# Weekly update on the **Mont de la Saxe landslide**

**LOW  
ACTIVITY**

Reference period, 01 June 2015 – 08 June 2015  
bulletin n.11, issued on 08 June 2015

**Trend of the maximum displacements over the last 7 days with respect to the previous update**

<2 / <2

4.8 / **4.2**

32 / **19**

**[cm/week]**  
Displacement measured in the last 7 days\*

LAST WEEK / THIS WEEK

**LOW  
ACTIVITY**

Landslide is active and displacements are revealed; displacement trend is low. By considering past records, is not possible to exclude local activations and/or rock falls.

**MODERATE  
ACTIVITY**

Displacement are locally high, and require specific attention. By considering past records, is not possible to exclude activations of moderate to large size.

**HIGH  
ACTIVITY**

Displacements are high and the trend in acceleration. The evolution of the landslide has to be carefully evaluated.

The monitoring network is divided, for sake of simplicity, in three different sectors corresponding to the scenarios considered for the Civil Protection plan.

\* the table provides the maximum values measured for each sector.
