In the article “Contribution of personal weather stations to the observation of deep-convection features near the ground” by M. Mandement and O. Caumont (Nat. Hazards Earth Syst. Sci., 20, 299–322, 2020), the following sentence is missing in the part “Data availability”:

“This study used a subset of the data provided by Netatmo. In particular, the total number of Netatmo stations and modules owned by users in metropolitan France can in no way be inferred from the data presented in the article.”
