

## ***Interactive comment on “The spatial domain of wildfire risk and response in the Wildland Urban Interface in Sydney, Australia” by O. F. Price and R. A. Bradstock***

### **Anonymous Referee #1**

Received and published: 7 October 2013

#### General comments

I find the paper quite interesting and almost flawless. Further insights could have been achieved had the authors considered the effect of previous fires (wild and prescribed) on the likelihood of fire spread into the WUI (see specific comment below).

#### Specific comments

P4542, L7. Is “long” the best word here? P4542, L22. Can you explain better why you lack data and methods? If fuel treatments and previous fires are mapped then an analysis is possible. P4542, L22. Shouldn’t you mention this paper?

#### Technical corrections

P4551, L28. Their, not there. Table 1. “Dependent” and “variable” and “predictor” and “variables” are in different columns.
