## Interactive comment on "Review "On the relation between the seismic activity and the Hurst exponent of the geomagnetic field at the time of the 2000 Izu swarm" by F. Masci and J. N. Thomas

## **Anonymous Referee #1**

Received and published: 8 May 2013

Firstly, thanks for the author reply. I agree with the authors. However, I still have a comment for this paper.

In Figure 1, we can find that not only a good correspondence between HU\_H and M  $^{\star}$  during the period 23-29 June, but also the average of the HU\_H values increase clearly during 26/6-25/8. Is it also cause by the daily sum of the Kp index? If it is I would suggest the author to show the increase of the daily sum of the Kp index values.
