I am sincerely grateful to Dr. Doong's kind comments. He has actually pin-pointed the weakest aspect of the approach used in this paper – that of relying on the information only available from the internet search engine. Understandably plenty of local happenings, like those happened around Taiwan, will be summarily missed from the internet reportings and data tally will certainly be unreliable! This facet of realism is just showing that while internet information can be useful to some limited extent, but it is clearly as yet far from able to supply an accurate world wide information on freaque wave occurrences!
