

Interactive comment on “GIS modelling of seismic vulnerability of residential fabrics considering geotechnical, structural, social and physical distance indicators in Tehran city using multi-criteria decision-making (MCDM) techniques” by F. Rezaie and M. Panahi

Anonymous Referee #1

Received and published: 17 December 2014

The base map for storing the scores for the attributes (the district map) would be indicated previously to the description of the indicators. The AHP is a weighted linear summation method, and most of the indicators are expressed as qualitative values, how has they been converted to quantitative to make the sum. It would be valuable that Tables 1 and 2 of the supplementary material were added as an annex (with the corresponding references in the text).
