The overall quality of the paper is good and some results are of great interest to improve the knowledge about the geological and seismological setting of the High Agri Valley basin. I only suggest to the authors to better analyse the implications of the MT results with the "scientific debate" about the main seismotectonic structures of the investigated area. Furthermore, I suggest to add some hydrogeological information and/or data (if available) and more details about the "melange" layer.
