For the General comments: I thank the anonymous referee for his valuable and fair comments. Indeed the paper is an Overview Paper which though indicates some critical points and deficiencies in the implementation of the Flood directive. For the Specific comments: Some sentences will be added in the final version of the paper to give more information on the concept of vulnerability. However, the sentence on kinematic wave routing deficiencies will be removed. For the Technical comments: I agree that Figures 3 and 4 have to be improved.
