This is an interesting and informative paper that presents contemporary thought as to the causality of the 7.2 Bohol Earthquake. There do not appear to be any major issues with the paper but here are some things that should, perhaps, be considered:

-The title is rather unspecific - what about the earthquake is the paper about!? -p2104  
- is "early morning" really necessary? -p2105 - at the top of the page, can the data be updated? It claims current as of Nov 2013 -p2016 - can you give the range of displacement rather than saying "as much as 3m"? Also, is there any progress on the current measurement operations in the field?

Figures 2 and 4 - perhaps date the images and locate on map
