

Supplement of

Comment on “Ultra low frequency (ULF) electromagnetic anomalies associated with large earthquakes in Java Island, Indonesia by using wavelet transform and detrended fluctuation analysis”, by Febriani et al. (2014)

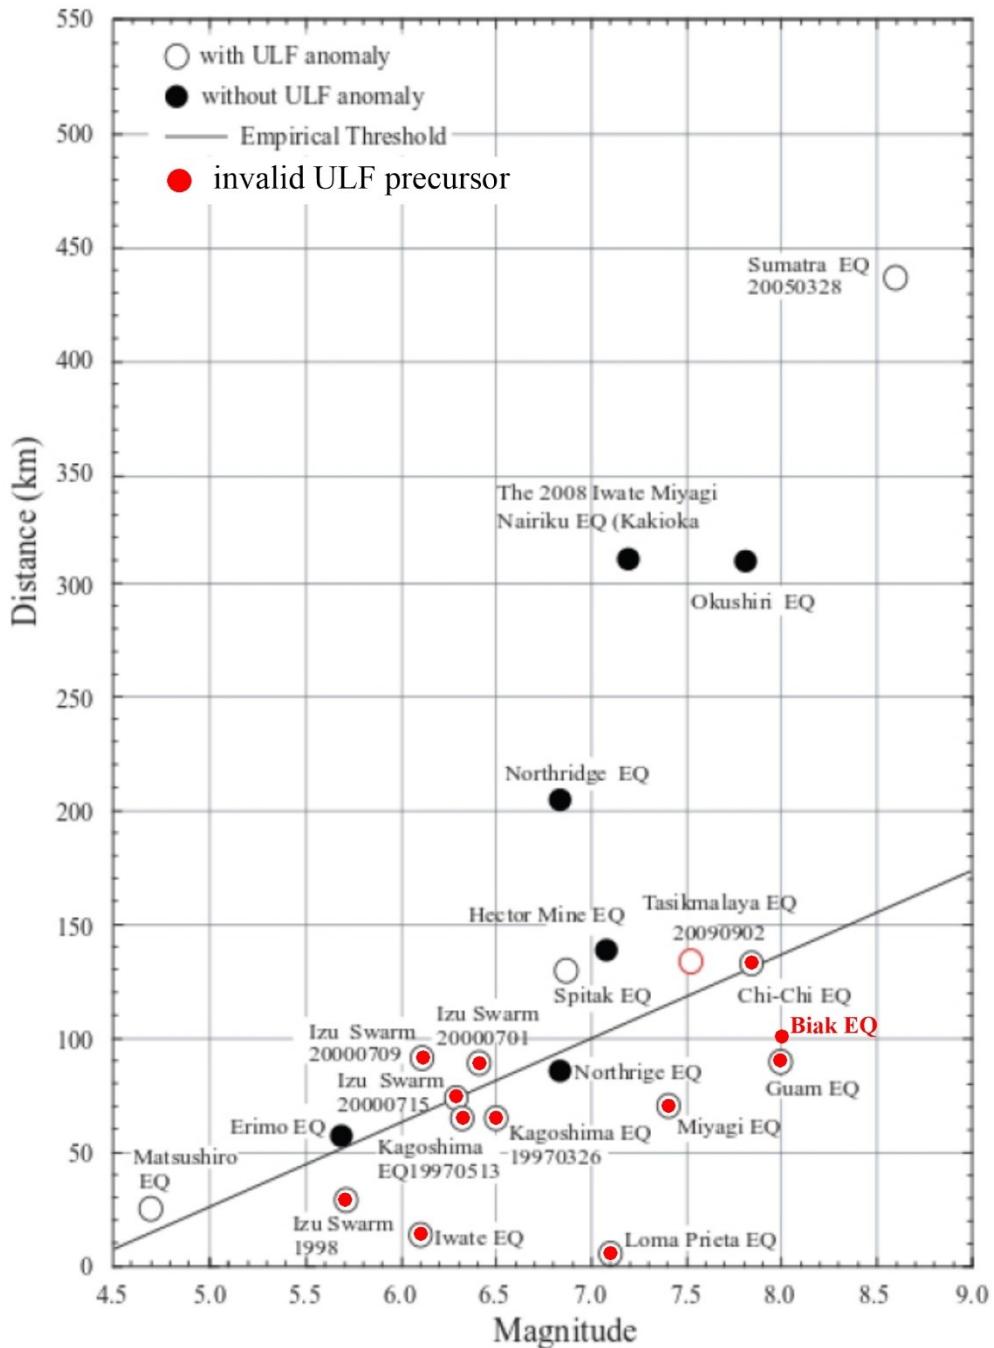

Figure S1. The black continuous line indicates the empirical relationship ($R = 40M - 180$) between the earthquake magnitude M and the distance R from the epicenter of the ULF station where the anomaly was observed (see Febriani et al., 2014, Fig. 10). We have included the Biak earthquake as in the original view by Hattori et al. (2004). Note that the relationship was derived using invalid ULF precursors (see Table S2).
