

Interactive comment on “Soil geohazard mapping for improved asset management of UK local roads” by O. G. Pritchard et al.

Anonymous Referee #2

Received and published: 22 July 2015

This is a worthwhile and well executed paper. The case study and figures are good.

My only minor comment is that the conclusions would benefit from being separated into a discussion of some of the implications of the results for road maintenance etc. (the first part of the conclusions at the moment) and then a conclusions section which summarises the scientific contribution for an international readership.
