Nice article on laboratory testing of rockfall impacts which are important to better understand the rockfall processes in the field.

Section 2.2:

Do you have experience and can you add something on repetition of single experiments: How much variation/spreading did you observe/expect?

The thesis of James Glover deals with this aspect, see also Glover J, Bartelt P, Petley D, Rosser N (2014) Characteristic rockfall runout behaviour of three end-member rock forms. Geophysical Research Abstracts. Vol. 16, EGU2014-16910.

Additional literature relevant for the proposed article:

Further laboratory impact experiments are described in the thesis of Barbara Heidenreich, see also: Labiouse, V., Heidenreich, B. (2009). Half-scale experimental study of rockfall impacts on sandy slopes. Natural Hazards and Earth System Science, 9(6), 1981-1993.

Performance of cushion layer is also described in the thesis of Kristian Schellenberg, see also: Schellenberg, K.; Volkwein, A.; Denk, M.; Vogel, T., 2008: Falling weight tests on rock fall galleries with cushion layers. In: Volkwein, A.; Labiouse, V.; Schellenberg, K. (eds) Interdisciplinary Workshop on Rockfall Protection. Morschach, Switzerland, June 23-25, 2008. Proceedings. Birmensdorf, Eidg. Forschungsanstalt WSL. 99-101.
