We truly appreciate all your comments and suggestions to this paper. We hope to improve this paper based on your recommendations.

Regarding on why the topic of propagation extent being on the discussion part, we've taken this approach to emphasize on how to utilize high resolution digital terrain model in identifying structural features and slopes that could fail. We've elaborated in the discussion part the parameters used were threshold values so that the hazard map shall overestimate and why we've chosen to include the result map on this part.

With regards to the formal aspect of the paper as well as figures, thank you for pointing those out. We hope to update the paper as recommended.
