

Interactive comment on “Analysis of how dry-hot wind hazard has changed for winter wheat in the Huang-huai-hai plain” by B. L. Shi et al.

Anonymous Referee #2

Received and published: 25 March 2016

The paper demonstrates the the effects of climate change on wheat production. Shangqiu is selected as the case study area to determine the occurrence regularity of dry-hot wind hazard on winter wheat production in Huang-huai-hai plain. The topic is useful for wheat production.

However, there are some questions as follows.I suggest major revision. 1. In the paper, the insignificant results are not reliable and helpful, such as in the introduction: From 1963 to 2012, a climatic mutation point of daily maximum temperature was found near 1972, but insignificantly ($p>0.05$).

2. The second paragraph in the introduction should be modified. The first two sentences in this paraphagh should be in the form of scientific paper, not like news. And the content in this paraphagh should be reorganized, maybe divided into two parts.

C1

3.Besides, the English should be improved for better understanding
