Review: NHESS_Silvestro et al.

This is a carefully and usefully constructed paper that combines high-end methodologies and pragmatic strategies to evaluate the risk and cost of flooding of an important Italian city. The clever part is the translation of a nearby storm of greater magnitude and risk level than that experienced at the same time in Genoa, to see how people and structures in a large city would be affected and at what cost. The technical passages report a study that is state-of-the-art in terms of the care and detail that has been

used in the development of the combined methodology. The reasoning and layout of the paper is exemplary. I have 2 requests: change 'stroke' to 'struck' in the title and elsewhere; correct some of the grammar in a very few places.

After the paper has been polished, I recommend that it is published in NHES.
