Dear Manuela Elissondo,

The leachate analysis actually did find fluoride, Hufner Osuna (2011) for instance reported 0.7 ppm, and Wilson et al. (2012) reported that no results of concern were found based on over 500 surface water analyses. Reports of tephra analysis did not mention fluoride among numerous elements which may be due to the methodology used. The fluoride values mentioned for ashes from the Cordon Caulle eruption averaging 548 ppm (range 491-620 ppm) were initially reported in Europ. J. Wildl. Res. 60:699 (2014) and were based on samples stemming from the following locations: -40 45' 48.28", -71 38' 51.54"; -41 13.928', -71 25.013"; -41 1' 0.95", -71 14' 16.25"; -41

13.936' -71 25.022'; -41 07', -70 44'; -40 13' 39", -70 58' 42"; -41 8' 17", -71 18' 33"

Thanks, Werner Flueck
