

Interactive comment on “Research Trends on Natural Hazards, Disasters, Risk Reduction and Climate Change in Indonesia: A Systematic Literature Review” by Riyanti Djalante

Dr Djalante

riyanti.djalante@gmail.com

Received and published: 19 December 2016

Dear Reviewer, The author would like to say thank you for the valuable comments given on this paper.

Kindly please find detailed responses to each issue raised in the review:

1. Comment: Abstract: The timeline considered isn't it from 1977 as expressed later in the manuscript (line 147; pg 6)?

Response: The sentence is revised Line 10: To address this, the author conducted a systematic literature review of related publications indexed within the SCOPUS database from 1900 to 2016.

[Printer-friendly version](#)

[Discussion paper](#)

2. Comment: The author reviews three main topics (1) HDR (2) DRR and (3) CC, but the introduction just focuses on the presentation of disaster events in Indonesia and on the comparison between geophysical and hydro-meteor-climato-logical disasters (is this last word correct by the way?). This small introduction (lines 24-35) does not give a clear picture of why the author undertook this review.

Response: Line 32: The aim is rewritten This paper aims to systematically review literature related to natural hazards, risk and disaster risk reduction, along with the strategies to mitigate and manage the events and impacts, as well as climate change vulnerability, impact, and assessments in Indonesia.

3. Comment: I suggest to report the information of figure 2 directly in the text and therefore to remove figure 2.

Response: Figure 2 is removed

4. Comment: Furthermore, after recognizing the gaps of knowledge, the author can present the objectives of the paper. Accordingly, I suggest to finish the introduction section with “this papers aims to systematically review..” that is presented from line 38 onwards in pg.2. Response: Line 30-55 show the elaborations on the aim of the paper.

5. Comment: Research method: The methodology has been undertaken correctly since few researchers explore the systematic literature review, as it is complex and time consuming. Anyway, the sub-chapter 2.1, 2.2, 2.2.1, 2.2.2 and 2.2.3 should be merged together into one main body under “2. Research methods”. The chapter 2.3 “Analysis and presentation of results” seems a repetition of the small subchapter presented before for which I suggest merging this in the previous chapter.

Response: The author reorganize this section completely, and to have only sub-headings 2.1 on Data Collection, and and 2.2 on Data Analysis.

6. Comment: Findings and Analysis: The categorization of disaster groups in table 4 is taken from EM-DAT 2016 and any added value is given. I suggest removing the table

[Printer-friendly version](#)[Discussion paper](#)

and integrating the citation in the text. When the author presents each topic (3.1.1-onwards), there is no need to explore them with so many small subchapters (timeline, discussions and focus areas). I suggest to merge these paragraphs trying to give an overall sequence and shape. The same for the topics 3.3.2 and 3.3.3. I think that there are some errors in the numbering of the chapters. Please revise it carefully. The discussion part presented from line 285 to 297 pg. 10-11 is not discussed at all. Please provide some ideas and key points on it. In its form it is a mere list.

Response: The author also simplified this section, and the small subchapters are merged.

6. Comment: The “Progress of Indonesian researchers and organization” chapter is valuable and I personally think that is the core of the paper, never explored in literature before. However, I think that this chapter could be presented without so many subchapters and the author needs to rearrange it merging the information into one main section. Please, try to present the results of this chapter without coping and pasting the paragraphs in chronologically way they are presented now. In addition, the text in lines 328-334 seems an advertisement of first authors as expressed in table 5. I would delete this information or rearranged the way it is presented.

Response: Section 3.2 is also simplified.

6. Table 5. Please report in the caption all the acronyms used (e.g PVMBG, ITB etc). I cannot understand the symbol put after SC, GS, RG. In addition, I would delete the column field “other profile” since does not give any added value. Does the author Surono have a name?

Response: All acronyms have been spelt out when they first used. Column on other profile is deleted Surono is a one name author as stated in Scopus

Received and published: 12 April 2017

Dear Prof. Malamud, Many thanks for your handling of the article.

I had just uploaded my latest changes based on 2 reviewers' reviews and 1 short comments from Prof. Marfai. He is one of the most prominent researchers on this topic (identified in this paper). I had also presented this paper at the UNU-TWIN SEA workshop by which key authors on the topics on DRR, CCA in Indonesia were present. The researchers represent those from ITB, LIPI, UGM and also those involved in UNU-EHS collaboration with LIP through TWIN-SEA network. They generally accept the findings and stated that the paper had been able to capture the progress for DRR research in Indonesia.

Interactive comment on “Research Trends on Natural Hazards, Disasters, Risk Reduction and Climate Change in Indonesia: A Systematic Literature Review” by Riyanti Djalante

Dr Djalante

riyanti.djalante@gmail.com

Received and published: 12 April 2017

Dear Prof. Marfai,

I would like to thank for your valuable comments which greatly enhance the quality of the recommendations, in particular. Kindly please find my responses below.

Please note that I have made changes to the paper as the response to the first reviewer which is listed in this site <http://www.nat-hazards-earth-syst-sci-discuss.net/nhess-2016-342/nhess-2016-342-AC1-supplement.pdf>. Hence, my numbering reference to your comments will be based on this revised version.

1. In the text line 272, we found the citation Sudibyakto (1992), which is not found in

[Printer-friendly version](#)

[Discussion paper](#)

the references. Please check it once again.

Response: In the revised version Line 979-981, all references to Sudibyakto 1992, 1996, 1997 are listed.

2. In line 288, you write the reference for Marfai (2014) and (2015), it is better to choose the print version one, instead of writing it both.

Response: Thank you, Marfai(2014) was deleted.

3. It would be more appealing if you can discuss more, about ecosystem bases Disaster Risk Reduction (DRR) and mention about the trend focus of disaster research In Indonesia.

Response: I put this as part of my recommendations: Sentences from Lines 453-456 are revised from:

There is still greater need for research on climate change topics related to linkages between poverty and disaster vulnerability (Suryahadi and Sumarto, 2003), security (CSIS, 2016), loss and damages (Warner et al., 2012), impacts on key sectors such as fisheries (USAID Indonesia, 2015), coastal communities (Marfai, 2014; Marfai et al., 2008), food security (Measey, 2012; WFP, 2015), health (Ady Wirawan, 2010; Haryanto, 2009), migrations (Raleigh et al., 2008; Reuveny, 2007), and community-based DRR (Heijmans, 2012),

to

There is still greater need for research on climate change topics related to linkages between poverty and disaster vulnerability (Suryahadi and Sumarto, 2003), security (CSIS, 2016), loss and damages (Warner et al., 2012), impacts on key sectors such as fisheries (USAID Indonesia, 2015), coastal communities (Marfai, 2014; Marfai et al., 2008), food security (Measey, 2012; WFP, 2015), health (Ady Wirawan, 2010; Haryanto, 2009), migrations (Raleigh et al., 2008; Reuveny, 2007), community-based DRR (Heijmans, 2012), and the role of ecosystem for DRR and CCA (Renaud et al

2016).

4. The paper should add more information about the importance of collaboration between local universities (Indonesia) and universities partner (outside Indonesia) to promote International publications in Indonesia, particularly to enlarge the topics related to the disaster, hazard, and risk reduction.

Response:

Line 469 New sentences are added. There needs to be more collaboration between local universities (Indonesia) and universities partner (outside Indonesia) to promote International publications in Indonesia, particularly to enlarge the topics related to the disaster, hazard, and risk reduction.

5. I would recommend adding references from another peer-reviewed literature except for Scopus, i.e. google scholar, or local database journals from Kemenristek DIKTI Indonesia, such as Shinta and Portal Garuda.

Response: It is not possible to use other databases at this stage. Goggle scholar was indeed used to determine major authors contribution, as listed in Table 3 (Line 345).

However, I add new sentences in Line 463 to acknowledge these databases.

Line 461. The author acknowledges that there are also Indonesia local database from Kemenristek DIKTI Indonesia, such as Shinta and Portal Garuda, and materials from these databases should be made available and accessible internationally.

6. The literature could also be taken from the books, proceedings, government's reports. Unfortunately, the government's reports are written in Bahasa Indonesia and not available for the public.

Response: It is clearly stated in the method section that the source is only from SCOPUS, which also include books, proceedings and sometimes reports. Those that are not included hence falls outside the scope of this paper.

7. To enrich the discussion in this paper, I would suggest searching other keywords associated with disaster and hazard, i.e. erosion, sedimentation, etc.

Response: Since the keyword 'Hazard' was used, any associated impacts from those hazards would have been included, include erosion and sedimentation, etc. Step 3 of the data inclusion already include these impacts.

Received and published: 3 May 2017

Dear Reviewer 3,

I would like to thank for your detailed assessment of the paper. I am delighted that you find the paper is valuable and contributes to the betterment and increased roles of Indonesian researchers in the future.

The review was extremely detail discussing on the terminologies, formats, references and abbreviations, and this has greatly improved the readability of the paper.

I greatly value your suggestions on focusing and outlining strategies on improving the authorship and quality of publications for Indonesian authors / researchers.

10 **Abstract**[DR1]. Indonesia is one of the most vulnerable countries from disasters and climate change. There have also been extensive literatures on the examinations of hazards, risks, disasters and disaster risk reduction strategies on Indonesia. To determine progress on those researches, the author conducts a systematic literature review on these topics. A multi-staged review was conducted to study publications that are indexed within SCOPUS with the timeline from 1900 to 2016.

15 The findings are outlined in two parts. The first part focuses on the research topics. The publications can be categorized into three major topics of (1) hazard, risks and disaster assessments (HRD), (2) disaster risk reduction (DRR), and (3) climate change risks, vulnerability, impacts and adaptation (CC). The oldest publication was in 1978. Publications on HRD are comprised of more than half of the total publications, focusing on volcanic eruption, tsunami and earthquake. Research on DRR focuses on governance, recovery and reconstruction, early warning systems. Those on CC are mainly on emission
20 reduction, forestry, governance, and impacts.

The second part focuses on roles of Indonesian researchers and organizations. Findings show limited progress in research, publications and collaborations. Non-Indonesia authors dominate the number of researchers. Only half of the publications are co-authored by Indonesians. International collaborations took place only by limited organizations. This could be contributed
25 by limited experiences on collaborations, power play amongst researchers, lack of capacity for research and English academic writings, and lack of incentives for international collaborations and publications within the education system.

Indonesia is one of the most vulnerable countries from disasters and climate change. While there has been a proliferation of academic publications written on issues related to natural hazards, risks, and disasters on Indonesia, there has not yet a systematic literature review (SLR) to determine the progress, key topics and directions for further research. SLR is important
30 so researchers can build upon existing works, avoid bias, determine major research and need for further research. It is also important to determine who, how, in which way the research has been conducted ~~in order to~~ strengthen research capacity in

the future. The author conducted a SLR of publications indexed within the Scopus database from 1900 to 2016 [DR2] on topics related to natural hazards, risks, risk reduction and climate change impacts on Indonesia. The findings are outlined in two parts. The first part focuses on the research topics and the findings are categorized into three major topics: (1) natural hazard, risk and disaster assessments (HRD), (2) disaster risk reduction (DRR), and (3) climate change risks, vulnerability, impacts and adaptation (CC). More than half the publications fall into HRD and focus on volcanic eruptions, tsunami and earthquakes. Publications on DRR focus on governance, early warning systems, and recovery and reconstruction. Those on CC are mostly on carbon emission, forestry, governance, and CC impacts. The second part focuses on roles of Indonesian researchers and organizations in these publications. Findings show limited progress in research, publication and collaboration. International/non-Indonesian authors dominate the literature and only half of the publications are co-authored by Indonesians. Moreover, international collaborations took place by and through very few Indonesian organizations. Reasons for this could be due to limited experience in academic collaboration, power play amongst researchers, lack of research capacity, weak English academic writings skills as well as a lack of incentives for international collaboration and publication within the Indonesian higher education system. The author recommends more funding and incentives for collaborations, inclusion of Indonesian authors in academic articles on Indonesia, training on English academic writing and journal article publications and for high impact publications, capacity building for early career, female and social science researchers, encourage multi-disciplinary collaborations, and lastly on science communication beyond academic publications to social media outlets and science-policy advocacy.

1 Introduction [DR3]

Disasters and their associated social and economic impacts are on the rise (EMDAT, 2016). The last decade has witnessed the highest number and impacts from disasters and 2015 has been declared as the hottest year ever (WMO, 2016). The Asia Pacific region has experienced the highest number of disasters on record (EMDAT, 2016), within which Indonesia is one of the most at risk countries to disasters and climate change impacts (EMDAT, 2016). [DR4] Between the period of 1900 to 2016 [DR5], there have been a total of 434 disasters in Indonesia caused by natural hazards, with 237,728 deaths, 29.1 million people affected and total damage almost 30 Billion USD (EMDAT, 2016). Geophysical disasters caused more than 90% deaths while the hydrological, meteorological and climatological disasters occur [DR6] more frequently, affected more people, and caused three times damages (EMDAT, 2016). The Sendai Framework for DRR (SFDRR) has just been adopted and with it an extension of the scope of hazards and risk reduction strategies (UN/ISDR, 2015). There is a move toward an integrated approach to DRR which calls for strategies and actions to reduce risks and associated impacts, as well as an inclusive role of multiple actors in DRR. The Indonesian government and other stakeholders are actively contributing for DRR (Chang Seng, 2013; Djalante et al., 2013; Djalante et al., 2012; Lassa, 2013). This review will enable the identification of strategies that have been undertaken for DRR and hence suggest strategies for future DRR and implementing the SFDRR. Also, there is an increasing focus on the

impacts of climate change in the changing profile of hazards and disasters, and hence this calls for integrated DRR and climate change adaptation (CCA) to manage climate risks (EMDAT, 2016). [DR7][DR8]

This paper aims to systematically review literature related to natural hazards, risk and disaster risk reduction, as well as climate change vulnerability, impact, and assessments in Indonesia. Even though there is vast material on these topics on Indonesia, there has not yet been a literature review that examines them in a comprehensive and systematic way. A systematic literature review (SLR) is defined as a method for systematically reviewing evidence or literature with explicit and transparent methods (Gill and Malamud, 2014). By reviewing published works through SLR, topics that have been heavily researched can be determined, researchers can build upon others' existing works, avoid bias and repeat heavily researched topics (Khan et al., 1996), and topics that need further research can be outlined (Moher et al., 2009b).

There are two research objectives adopted. [DR9] *First* is to determine progress of research in natural hazards, risks, disasters and climate change in Indonesia within the timeframe from 1900 to 2016. This paper identify strategies that have been undertaken for DRR and hence suggest strategies for future DRR and implementing the SFDRR. The Sendai Framework for DRR (SFDRR) has just been adopted and with it an extension of the scope of hazards and risk reduction strategies (UN/ISDR, 2015). There is a move toward an integrated approach to DRR which calls for strategies and actions to reduce risks and associated impacts, as well as an inclusive role of multiple actors in DRR. This review will enable the identification of strategies that have been undertaken for DRR and hence suggest strategies for future DRR and implementing the SFDRR. Also, there is an increasing focus on the impacts of climate change in the changing profile of hazards and disasters, and hence this calls for integrated DRR and climate change adaptation (CCA) to manage climate risks (EMDAT, 2016). This review will try to capture whether consideration of climate change risks have been considered as part of research progress in Indonesia. *Second* is to examine roles and progress of Indonesian authors in contributing to research, international publications and collaborations. This is important and relevant for several reasons. It is important to gauge who, how and in which way the research has been conducted so that future strategies and consideration for strengthening research capacity can be recommended in the future (Mallett et al., 2012). Indonesian scholars have most likely lived in Indonesia for a considerable amount of time. They have experienced, assessed and examined those social and environmental changes that have shaped natural hazards and disasters in the first place, which will help them to be more focused and sharp in terms of documenting. Also, in Indonesia, there is an increasing pressure for scholars to write for international journal publications and collaborate. Any outputs from these publications and collaborations are used toward counting their ranks as academics in universities and research institutions (GoI, 2014). Hence identification of this progress through SLR will enable to determine recent progress undertaken by Indonesian researchers, and can help outline recommendations for further actions in the future to increase the quality of publications and roles in collaborations in international spheres.

The structure of this paper is as follows. The first section of this paper has presented the rationale, aim and research questions. The second section outlines the research method related to data sources and document selection. The third section gives the analysis and presentation of results and is divided into two sub sections, the first on key research topics and timelines, and the second on the progress of Indonesian researchers and organizations. The last section presents the conclusion and

recommendations for further research and strategies to improve the quality of collaborations and scientific publications for Indonesian authors and organizations.

2 Research method [DR10]

2.1 Data collection and multi-stage processes

- 5 The SLR method has been used in the fields of health (e.g. Moher et al., 2009a), software engineering (e.g. Kitchenham et al., 2009), and engineering (e.g. Gosling and Naim, 2009). There have also been studies that use this form of review in topics related to natural hazards, disasters, and climate change. They are however have been done individually. ~~This papers~~ This paper examines those research progress as an integrated analysis. Examples include reviews of different natural hazards such as droughts (Woodhouse and Overpeck, 1998), landslides (Aleotti and Chowdhury, 1999), wildfires (Neale and Weir, 2015),
- 10 tsunami (Chiu and Ho, 2007), and the interactions of those natural hazards (Gill and Malamud, 2014). Others focuses on the impacts (Hunt and Watkiss, 2011) and DRR strategies from social science perspectives such as ecosystem-based adaptation (Brink et al., 2016; Kabisch et al., 2015), education (Johnson et al., 2014), health and psychology after disasters (Kölves et al.; Harada et al., 2015), volunteerism (Whittaker et al., 2015), disaster management (Beerens and Tehler, 2016; Lettieri et al., 2009; Gall et al., 2015). [DR11]
- 15 A significant works on the systematic review of climate change studies has been done by Berrang-Ford et al (2015; 2015; 2012). Berrang-Ford et al (2011; 2015) suggested an analytical approach for an SLR need to outline the research questions and aims, data sources and document selection, and analysis and presentation of results. They stated that the questions and aims needed to be clearly described and explicit; the data sources needed to be justified and described, including the articulation of the articulation of search term and description of inclusion and exclusion, along with the documentation of literature included
- 20 and excluded. They added that the methods for analysis needed to be described and the quality of information needed to be critically appraised (Berrang-Ford et al., 2015). These approaches are adopted in this paper.
- ~~In regard to~~ Regarding the data sources and document selection, the author conducted a multi-layered literature review to study publications using the Scopus research engine, with a timeframe from 1900 to 2016. There have been several studies comparing the strengths and weakness of Scopus, PubMed, Web of Science and Google Scholar (e.g., Bakkalbasi et al., 2006; Bar-Ilan,
- 25 2008). The Scopus research engine was selected because it has the largest database of peer-reviewed literature (Leydesdorff et al., 2010). Scopus has within its features the capability for search, discovery and analysis (SCOPUS, 2016b). Additional information is gathered from Google Scholar (Google, 2016c), Research Gate (Gate, 2016) or researchers' profiles (if available) to give the full extent of particular scholars' works. The author checked the organizations, nationalities and genders of the researchers using Google search.
- 30 Multi stage processes are taken to determine inclusion and exclusion for more relevant findings. The materials considered are those listed by SCOPUS by February 26th, 2016. The key research terms adopted are *natural hazard, disaster, disaster management, disaster risk reduction, climate change, climate change adaptation, resilience, vulnerability, geology, and*

Indonesia. The first stage gave a total hit of 8077 publications. The author applied the second stage to further refine the results. The exclusion included refinement in subject areas, document types, and source title which did not directly related to the topics. This gave a total hit of 3447 publications. The third stage involved downloaded the results into xml format, saved and imported them into Microsoft Excel. When importing into Excel format the author chose all delimiters to ensure information went into the right column. However, the results were not always consistent and hence a manual check on each entry row was needed. The author found that the number counts on the authors' publications and citations presented in the Scopus search were sometimes different to the actual check of the Excel sheet. It was also different when examining the profile of one author. Hence, to ensure consistency, higher number of publications and citations are selected. The results in the Excel format were examined line by line to further determine exclusion from the lists. Materials that were excluded in this final stage were related to research in the mining industry in Indonesia, those discussed the science of climate change in very general scope and those that touched on the issue of disasters but not specifically in Indonesia. Further exclusions were warranted when the author judged the scope was too broad to be included in the review. In the end 921 materials selected. The three stages along with the inclusion and exclusion terms are Table 1.

Table 1: Multi-Stage Processes for Inclusion and Exclusions for Search Terms

2.2 Data Analysis

The third/final list was analysed in terms of topics and sub-topics of research citations, keywords, places of focus, types and time of publications, impact factors and authorships. The author used Scopus features to analyse search results such as the article metric module, citation overview, and author profile pages (SCOPUS, 2016b). The progress of Indonesian scholars is evaluated through counting total number of authors, research outputs and citations overall, and comparing between papers first authored by Indonesians. The author cross-checked the number of citations from Scopus on the Internet through Google, and selected the higher citation counts. This was done because it is generally the case that data from a Google search for a publication and author leads to a higher and more up to date citation count. The author also consulted total citations and publications of researchers in Google Scholar, Research Gate or from other websites to make sure that the full list of publications was captured. There were also cases where the author had to specifically go back to Scopus and find author's works to make sure that all were captured.

3 Findings and Analysis^[DR12]

This section is structured into two main parts reflecting the objectives of the paper, first with progress of research in terms of key research topics, and second with progress of Indonesian researchers and organizations.

This part presents the more detailed findings of each of the research topics. The author categorizes the final list into three groups (Table 2), natural hazard, risk, disaster assessments (HRD), disaster risk management and reduction (DRR), and climate change vulnerability, impacts and adaptation (CC), to show and outline how changes in directions on research have taken place over the years and to reduce unbalance towards findings on hazard and risks assessments toward earthquake and volcanic eruption research. In general, there are more research on the topic of HRD (56%), followed by those in DRR (23%), and then CC (21%) (modified from SCOPUS, 2016a).

Table 2: Major Research Topics

The paper further identifies key periods and timelines by which publications were published. Although the search timeline was set between 1900 and 2016, the years in which publications were found ranges from 1934 to 2016 (Figure 1).

Figure 1: Number of Publications over the Year (modified from SCOPUS, 2016a)

The first period is from the 1934-1990s. There were no significant changes in the numbers of publications produced. The publications on the HRD are some of the earliest publications indexed in Scopus. It heavily focused on the topics of geophysical hazards and risks related to earthquakes and volcanic eruptions (SCOPUS, 2016a). Within this period, 22 out of 58 events recorded by EMDAT were earthquakes and volcanic activities (EMDAT, 2016). The Bali earthquakes occurred in 1976 and 1979, which in total caused 1764 deaths, affected 563,150 people, and caused 215,150 USD in damages (EMDAT, 2016). The year 1979 was also the year in which the earthquake occurred the most (6 times), in Bali, Lombok, and Biak (near Papua) (USGS, 2016).

The second period from the 1990s to 2000s shows a notable increase in the literature, up to an average there 10 publications per year. This gradual increase mainly corresponds to a rise in literature related to the assessments of HRD, and is followed by a sharp increase in literature to its highest point in 2000 (SCOPUS, 2016a).

The third period from 2000s-2010s was the most dynamic period for publications. While there was a sharp decline since it first peak in 2000, a surge of publications begun in 2004 in response to the Indian Ocean tsunami which devastated Indonesia especially. This increase has continued ever since. This is also a period characterized not only publications related to understanding the risks of earthquakes and tsunami, but also those related to DRR and CC. A peak occurs between 2010 and 2016 which shows soaring published materials in all topics. There were 153 publications in 2016 which is the highest ever produced in a single year. During this period, publications related to CC has started to be published. Both publications on HRD and CC are expected to rise (SCOPUS, 2016a).

The following sub-sections outline research issues discussed within the three topic groups. Within each, the paper discusses timelines, focus areas of the research, early contributors, and categorization of key topics discussed.

3.1.1 Natural hazards, risks and disasters assessments (HRD)

The first sub-section explains findings on the topic of hazards, risks and disasters assessments and identifications. The EMDAT-CRED (2016) categorization of HRD that is used in this study to help more detailed analysis related to major research topics. Natural-disaster groups only caused by geophysical, meteorological, hydrological, and climatological hazards are included since it is determined that these are the most frequent and impactful disasters in the country.

There are 535 publications in this category (SCOPUS, 2016a). The findings show that there has been a gradual increase in the number of published materials from 1934 to 2000. It first reached its first peak in 2000 that the research in this topic reached its first significant outputs of 25 publications, and reduced slightly after that. In 2004 the Indian Ocean tsunami occurred, initiated with the 9.8 M earthquake with the epicenter off the island of Sumatra, badly affecting Indonesian. Publications related to the tsunami continued to be published until it reached a peak in 2006. Then in 2009, the publications have increased rapidly ever since, reaching another peak in 2016 of 153 publications in a single year (SCOPUS, 2016a).

The literature in HRD category are mostly related to the study of volcanic eruptions, earthquakes and tsunami and the islands of Java and Sumatera are the two areas which receive most attention (more than 70%) (SCOPUS, 2016a). The oldest publications listed in Scopus are those by Reinout Willem van Bemmelen, a Dutch national born in Batavia (Netherlands East Indies/Indonesia), on *Ein Beispiel für Sekundärtektogenese auf Java* (An example of secondary isogenesis on Java) (van Bemmelen, 1934) and *Über die Deutung der Schwerkraftanomalien in Niederländisch-Indien* (On the Interpretation of the Gravity Anomalies in Dutch-India) (van Bemmelen, 1935), both from the *Geologische Rundschau* (now listed as the International Journal of Earth Sciences). Van Bemmelen continued to write extensively on theories in Tectonophysics, and on Indonesia (van Bemmelen, 1935, 1941, 1949b, 1953, 1963). He then wrote in English on the Origin and Mining of Bauxite in Netherlands-India (Van Bemmelen, 1941) and on the Report of Volcanic Activity and Vulcanological Research in Indonesia (1936-1948) (van Bemmelen, 1949b) from the *Bulletin of Volcanologique*. These works formed his greatest contribution: The Geology of Indonesia (Van Bemmelen, 1949a; Van Bemmelen and Bourter, 1970). In addition, Rittman (1953) wrote specifically on the Magmatic Character and Tectonic Position of Indonesian Volcanoes. In terms of contributions by Indonesian researchers, John Ario Katili of the Bandung Institute of Technology (ITB), considered one the founding fathers of Indonesian Geology, wrote significant accounts on geotectonic knowledge of Indonesia from the period of 1963 to 1991 (Katili, 1975, 1991, 1974, 1967, 1971, 1989, 1969a, 1978, 1986, 1981b; 1963; 1969b, 1981a, 1980, 1973). Other early and significant contributions come from Mudaham Taufick Zen and Djajadi Hadikusumo, from the Geological Survey of Indonesia, who collaboratively wrote some of the earliest and most important accounts on volcanoes in Indonesia (Zen and Hadikusumo, 1965, 1964b, a; 1971, 1970, 1966; 1974). It is also important to mention, though not indexed in Scopus, the work by Kusumadinata (1979), of the Geological Survey of Indonesia, on the Catalogue of References on Indonesian Volcanoes with Eruptions in Historical Time, amongst others (Kusumadinata, 1963, 1964a, b, c; cited in Rampino and Self, 1982).

Publications that are related to volcanic eruptions are dominated by the study of volcanoes in Java (almost half) such as Merapi (Verstappen, 1988; Lavigne, 1999; Voight et al., 2000; Andreastuti et al., 2000; Charbonnier and Gertisser, 2008; Gertisser et al., 2012; Suryo and Clarke, 1985), Galunggung (Suryo and Clarke, 1985), Semeru (Siswowidjoyo et al., 1997; Carn, 1999; Thouret et al., 2007; Solikhin et al., 2012), Kelud (Lubis, 2014; Nakada et al., 2016) or Ijen (Heikens et al., 2005; Trunk and Bernard, 2008; van Hinsberg et al., 2010). The other hazard that receives many studies is related to the examination of earthquakes (more than 30%), how they happened, and methods to assess the impacts. The research on tsunami received gradual attention especially after 2004 (Nakamura, 1980; Nakamura, 1978; Latter, 1981; Koshimura et al., 2009; Imamura et al., 1995). There are also a small number of publications related to landslides (Fathani et al., 2016; Karnawati et al., 2011; Liao et al., 2010) (Figure 2).

Figure 2: Key Topics in HRD Category (Source; modified from SCOPUS results)

3.1.2 Disaster risk management and reduction (DRR)

The second sub-section is on the topic of disasters risk reduction (DRR). In this study, DRR included those strategies that are aimed at reducing disaster risks and range from risk management to risk reduction including disaster preparedness activities. The definition is listed in Table 3. There are 206 publications in this category (SCOPUS, 2016a). **Timeline**

There have been very few publications published before 2003. It is only after 2004 that there was a gradual increase of publications. This reached its peak in 2008, after which the number slightly reduced, before continuing to increase. More than half of the DRR publications focus on Sumatera and Java. However, there are also studies that examine Indonesia as part of worldwide, regional or national assessments (SCOPUS, 2016a).

The earliest accounts that explicitly examine DRR include Suryo and Clarke (1985) who wrote on the Occurrence and Mitigation of Volcanic Hazards in Indonesia, and laid out strategies such as the prediction of volcanic activity, hazard zoning and maps, and control of hazards through engineering structures. They wrote that ‘the main purpose of hazard maps is to assist the protection of people and their property near active volcanoes’ (Suryo and Clarke, 1985, p. 90). Verstappen (1994; 1993, p. 367) in his paper, the Volcanoes of Indonesia and Natural Disaster Reduction (with Some Examples), wrote that ‘*since emergency scenarios inevitably vary with intensity and type of land utilization, the compilation of vulnerability maps of the endangered areas merits consideration in the context of disaster reduction policy*’. An Indonesian notable scholar is Sudibyakto, from the Faculty of Geography, University of Gadjah Mada, and also the head of the Indonesia Disaster Scientist Association (IABI), who wrote Natural Disaster Mitigation and Management in Indonesia (Sudibyakto and Haroonah, 1997) and examine disaster from geographical and social science perspectives (Sudibyakto and Haroonah, 1997; 1992; 1996).

Discussions

The topic that receive most attention in this category is related to the governance of DRR (Bakkour et al., 2015; Chang Seng, 2013; Djalante et al., 2013; Djalante et al., 2012; Guarnacci, 2012; Lassa, 2013). The next key topic is on the evaluation of recovery and reconstruction that have taken place after the 2004 Indian Ocean tsunami (Chang et al., 2011; Daly and Brassard, 2011; Godavitarne et al., 2006; Guarnacci, 2012; Karan and Subbiah, 2011; Telford and Cosgrave, 2007; Lassa, 2015). Other

topics that are also related to the impacts of tsunami and disasters were the role of culture, gender, or religion in helping community resilience when facing disasters, and impacts of disasters on different community groups including children and woman (Baumann, 2008; Donovan, 2010; Donovan et al., 2012; Gaillard et al., 2008b; Islam and Lim, 2015; Balgos et al., 2012; Guarnacci and Di Girolamo, 2012; Hiwasaki et al., 2015; Siagian et al., 2014; Sagala et al., 2009; Schlehe, 2010). Some topics were related to examination of tsunami early warning system (Schlurmann and Siebert, 2011; Steinmetz et al., 2010). There are also many publications which examine the role of knowledge and information to help communities be more prepared for disasters (Dicky et al., 2015; Hiwasaki et al., 2015; Rafliana, 2012). There are 13 publications comparing Indonesia and Sri Lanka in regards the impacts of the tsunami on how it either become the precursor for peace process in Indonesia but still take time for the process in Sri Lanka (Enia, 2008; Gaillard et al., 2008a; Hyndman, 2009; Kelman, 2005). Some lower numbers of papers examine community-based DRR which is strongly related to community preparedness (Adiyoso and Kanegae, 2013; Birkmann et al., 2015; Hidayati, 2012; James, 2008; Kusumasari and Alam, 2012), and others examine how children are affected psychologically from continuous exposures to hazards and disasters (Du et al., 2012; Lawler and Patel, 2012; Taylor and Peace, 2015; Vignato, 2012), and on emergency management at the local or national level (Esteban et al., 2013; Kusumasari and Alam, 2012; Djalante et al., 2012). Figure 3 summarizes the key topics in DRR category.

15 **Figure 3: Key Topics in DRR Category (Source; modified from SCOPUS results)**

3.1.3 Climate change risks, vulnerability, impacts and adaptation (CC)

The third sub-section is related to climate change risks, vulnerability, impacts and adaptation (CC). The research on climate change is interpreted broadly in this paper. The author included all materials that discuss the impacts of climate change not only on disasters caused by natural hazards but also in different sectors such as agriculture, forestry, water and health. This has been done since the current Sendai Framework for Action calls for multi-risks perspectives (UNISDR, 2015). There are 182 publications in this category (SCOPUS, 2016a).

Timeline

There have only been a few publications within the period between 1978 and 1990. The second period between 1990 and 2000 saw a slight increase in the literature, and then there were 5 pieces published in 2001. These are related to examinations of the causes and impacts of forest fires in Indonesia. The numbers of publications did not change in general until 2008. It is only after 2010 that there was a sharp increase in the numbers of publications, reaching its peak in 2015 at 35 papers. The islands of Sumatera and Java has become the two major locations for the research of the climate impacts since they are the areas where the greatest number of paddy fields and crops production is concentrated (McCulloch and Peter Timmer, 2008). There are also increasing research related to climate change impacts on different sectors at various locations in Indonesia such as those in Sulawesi and in the eastern part of Indonesia (SCOPUS, 2016a).

Discussions

Some earliest publication were written in 1992 by Subijakto (1992) who wrote Facts and Future Trends of Climate Change: A Case Study of the Eastern Part of the Indonesia Islands, and by Murdiyarso (1993) who examined the management of climate

change impacts to reduce CO₂ release resulting from deforestation and biomass in Indonesia. The author categorizes the 182 publications in this group into three major discussions related to the impacts of climate change on Indonesia (almost 60%), the governance of climate change adaptation (less than 25%), and issues of deforestation and land degradation which had enormous impacts on the Indonesian rain forest. Indonesia houses some of the largest areas of rainforest in the world, especially on the islands of Sumatera and Kalimantan. Since the majority of materials published in this category are related to the review of the impacts on climate change in Indonesia, this paper takes a deeper on those literatures (Figure 4). The impact on crop production, particularly rice, has been the subject of the majority of climate impact researches (Caruso et al., 2016; D'Arrigo et al., 2011; D'Arrigo and Wilson, 2008; Kawanishi and Mimura, 2015; Keil et al., 2009; Naylor et al., 2001; Sano et al., 2013; Shofiyati et al., 2014). This is strongly related to the examination of flood (Marfai and King, 2008; Marfai et al., 2008; Marfai et al., 2015; Muis et al., 2015; Neolaka, 2013, 2012; Sarminingsih et al., 2014; Shrestha et al., 2014) or droughts in Indonesia (Aldrian and Djamil, 2008; D'Arrigo and Smerdon, 2008; D'Arrigo and Wilson, 2008; D'Arrigo et al., 2006; Keil et al., 2009; Keil et al., 2008). A high number of publications also concern the link between droughts (Salafsky, 1994; D'Arrigo et al., 2006; D'Arrigo and Smerdon, 2008; Shofiyati et al., 2014) and fire occurrences (Usman and Hartono, 1997; Fang and Huang, 1998; Brauer and Hisham-Hashim, 1998; Jim, 1999; Stolle and Tomich, 1999; Page et al., 2002; Stolle and Lambin, 2003), especially forest fires. There is also research on sea level rise and its impacts on coastal areas (Budiyono et al., 2016; Ward et al., 2013; Firman et al., 2011; Wassmann et al., 2009; Nicholls et al., 1995). A small number of research focuses on temperature, rainfall (D'Arrigo and Wilson, 2008; Aldrian and Djamil, 2008; Chrastansky and Rotstayn, 2012). The impact of climate change on health (Coughlan de Perez et al., 2015) and animal (Purnomo et al., 2011; Morwood et al., 2008) has also received some attention. Figure 4 summarizes the findings.

Figure 4: Key Topics in CC Category Researching on Impacts of Climate Change (Source; modified from SCOPUS results)

3.2 Progress and Roles of Indonesian researchers and organizations [DR15]

This second section examines the roles of Indonesian researchers and organizations in contributing to the production of literature. It also addresses to what extent Indonesian researchers have been collaborating with other international/non-Indonesian researchers and organizations, and in producing high impact English journal articles. The roles of authors are examined in general term, and specifically looking at the 10 highly cited papers with Indonesian as first author.

3.2.1 Authorships

Figure 5 summarizes the roles of Indonesian authors within each publication category (HRD, DRR, and CC). The review finds that out of the 3,000 names obtained from the Scopus search, there are 68% of international authors compared to 32% Indonesian author. The contribution of international/non-Indonesian authors dominates the production of publications. The figure shows that there are more authors, including Indonesian authors, in DRR category than the other two categories. There are slightly more papers with at least one Indonesian author than those with no Indonesian authors. A more striking examination of Indonesia authors shows that there are less than 100 authors with more than 2 publications. The majority of authors work

for organizations that are located in Java where the high quality education providers are mostly located (OECD and ADB, 2015), dominated by male researchers and only a small minority of these researchers have social media account such as Google Scholar (Google, 2016a) or Research Gate (Research Gate, 2016b) or professional and personal websites. This implies that there is room for increasing the involvement of Indonesian authors writing about various issues related to DRR, and a greater opportunity for developing social science in DRR. More Indonesians need to be involved in international publications and specific interventions are needed to enhance writing, publication and outreach skills.

Figure 5: Comparing the roles of international and Indonesian authors in each publication category (source: modified from SCOPUS results)

Table 3 compares the list of the top ten authors with highest number of publications and also the Indonesian authors with the 10 highest publications. Highest in the list is Hasanuddin Zainal Abidin of the Bandung Institute of Technology (ITB), with 71 publications listed in Scopus, while his Google scholar profile shows that he has published 172, with 1709 citations (Google Scholar, 2016b). Franck Lavigne from *Université Paris 1 Pantheon Sorbonne* published the second highest numbers of papers (Google Scholar, 2016a). Lavigne worked closely with Jean-Claude Thouret from *Laboratory Magmas et Volcanis (LMV)*, 2016). Danny Hilman Natawidjaja works for Indonesian Institute of Science (LIPI) (Google Scholar, 2016c) but did his bachelor study from ITB. Kerry Sieh, from Earth Observatory of Singapore (EOS), has long collaborated with Natawidjaja on their works on seismology in Indonesia (EOS, 2016). Barry Voight is a renowned geologist and volcanologist in USA who has worked on the Mount Merapi since the 1980s (Google Scholar, 2016e). Ralf Gertisser is a senior lecturer in Keele University (Google Scholar, 2016d). Bambang Widoyoko Suwargadi is affiliated with LIPI and Surono (1 name only) and Muhammad Hendrasto both work for the Center for Volcanology and Geological Hazard Mitigation (PVMBG, 2016). In addition to the 5 Indonesians in the top 10 authors, Irwan Meilano, Heri Andreas and Irwan Gumilar have worked closely with Abidin, and are all affiliated with ITB. Muh Aris Marfai and Junun Sartohadi are from the Gadjah Mada University (UGM).

This result shows a great deal of need for increasing the capacity of Indonesian authors meet standards for internationally regarded journal publications. There are a limited number of authors involved with publications in the highest impact factor (IF) journals such as Nature and Science. Indonesian authors largely lack experience in international collaboration and the language and writing skills necessary for submitting their works to internationally accredited journals: High impact articles and collaborations were only done through organizations centred on ITB, UGM, LIPI and PVMBG. Despite some Indonesian researchers who have been strongly influential within the study of hazards, DRR or climate change in Indonesia and could potentially contribute to the global development of knowledge in these fields, they have only published in Bahasa Indonesia and did not submit their works into international mostly English language journals.

Table 3: List of top ten authors with highest number of publications, and top ten Indonesian authors (SCOPUS, 2016a; Google, 2016b; Research Gate, 2016a)

3.2.2 Affiliations

This section systematically examines the place, from regional to national, and organizations by which the researchers are affiliated in Indonesia. The organizations which house the ten most productive publications related to this review are shown in Figure 6. In general, there are an equal number of organizations that are based in Indonesia, and their contributions comprised slightly more than half the overall contributions amongst these most productive agencies. This paper looks deeper at the contribution of different organizations within Indonesia. It is shown that the Bandung Institute of Technology (ITB) and Gadjah Mada University (UGM) dominate almost half the total publications. There are also more twice universities in Java than those outside Java, while the rest of publications are contributed by national level organizations such as the Indonesian Institute of Science (LIPI) and Center for Volcanology and Geological Hazard Mitigation (PVMBG).

Figure 6: Organizations with highest number of publications (Indonesian Organizations marked in Red) (source: modified from SCOPUS results)

3.2.3 Publications sources

This section presents the source of publications. The majority of publications from journals are those that got indexed, compared to conference proceedings, books, or others. A closer look at the journals shows those related to geophysical hazards (volcanoes, earthquakes, tsunami, etc) identification and assessments dominate the numbers of papers published on Indonesia (Table 4).

Table 4: List of most submitted journals (source: modified from SCOPUS results)

Moreover, the Indonesian Journal of Geography is the only Indonesian journal that is found this review. The journal was established in 1961 by the Faculty of Geography, UGM in cooperation with the Association of Indonesian Geographers (UGM, 2016). There are no clear counts on the number of academic journals in Indonesia, however, there are only 245 accredited by DIKTI (Higher education directorates of the Ministry of Education) (DIKTI, 2016b) and 17 indexed in SCOPUS (DIKTI, 2016a). In addition, none of these journals have yet obtained an impact factor, and hence a Scientific Journal Ranking (SJR) Score is presented instead (SJR, 2016).

3.2.4 Citations

This section analyzes the citations for each topic category. Overall, the HRD category has the highest number of citations, in total more than two thirds (3945/5291) of all citations. A look of the citation averages, however, shows quite a different story. Whilst the CC literature category has the least number of papers published (194), the citation average is twice of the DRR category (3,18). Figure 7 shows the comparison between the progress of Indonesian researchers in the 10 most cited papers overall and those first authored by Indonesians. The role of first author has been considered significant since they are traditionally assumed to lead the research and write most of the content, and therefore receive most credit (Riesenberg and Lundberg, 1990; Hu, 2009). It shows that there are more authors, mostly international authors in the 10 most cited papers, while there are more Indonesians in the 10 most cited papers first authored by Indonesians. This might suggest that Indonesian

researchers tend to work with other Indonesians and hence needed to expand their collaborations with international scholars as a strategy to increase their number of citations and ability to submit for higher impact journals.

Figure 7: Comparing the Roles of Indonesian Researchers in the 10 Most Cited Papers (source: modified from SCOPUS results)

Table 5 shows the list of the 10 most cited papers of all publications. Within the 10 most cited papers, the total citations are 4,204 with a combined impact factor (IF) of 293.618, and only one third of the authors are Indonesian. The citation is three times of those first authored by Indonesians, and the IF is 4 times greater. It is shown that they are published in high impact factor journals such as Nature, Science, or those related to geophysical hazards. The two highest cited papers are published in Nature and discuss the impacts of forest fires in Indonesia. The paper related to the examination of the amount of carbon released from peat and forest fires in Indonesia in 1997 has the highest citation of 1287 by Page et al (2002). The majority of the papers discuss major hazards from the earthquake in Sumatera (Ishii et al., 2005; Briggs et al., 2006; Hsu et al., 2006; Konca et al., 2008), to the impacts of Toba (Rampino and Self, 1992) and Merapi volcanic eruptions (Voight et al., 2000). Eight papers were also contributed by Indonesians with Natawidjaja was involved in five of them. Jaya and Limin are both lecturers from the Palangkaraya University in Kalimantan, where forest fires frequently occurred across the rain forest and impacted not only Indonesia but also surrounding countries in the region such as Singapore (Tay, 1998) and Malaysia (Khandekar et al., 2000). Natawidjaja and Subarya, along with Sieh contributed the most (Briggs et al., 2006; Hill et al., 2012; Horspool et al., 2014; Hsu et al., 2006; Konca et al., 2008; Muhari et al., 2010; Nalbant et al., 2005; Philipbosian et al., 2012; Prayodhie et al., 2012; Schlurmann et al., 2010; Singh et al., 2010).

A closer examination of the list of ten most cited publications with Indonesian first authors shows a very striking picture. The total citations are only 1542, with a combined IF of only 70, 012, with 80% of all authors being Indonesian. The papers are much more varied in terms of topics they discussed. The first two most cited papers are related to impacts of climate change in Indonesia. Aldrian (2003), Susanto (2003; 2001) and also Amien et al (1996) authored papers related to climate change or its impacts on Indonesia. Natawidjaja (Natawidjaja et al., 2006; Natawidjaja et al., 2004) and Abidin (Abidin et al., 2001; Abidin et al., 2011) both have 2 papers to contribute each within the list of most cited papers first authored by Indonesian on earthquakes and land subsidence assessments. One paper examines the impacts of volcanoes (Andreastuti et al., 2000). Marfai wrote extensively on coastal risks and disasters in cities such as Semarang or Jakarta (Marfai and King, 2008; Marfai et al., 2008; Marfai et al., 2015; Ward et al., 2013; Marfai, 2014; Marfai and King, 2007). This table shows that in generals, Indonesia authors' still write papers with fewer citations, and the organizations that house these authors are still extremely limited to ITB, UGM, LIPI, and PVMBG. Another significant finding here is that there is no paper on DRR. This is an important finding that which also show how social science perspectives needed to be taken up by the Indonesia researchers in dealing with the management of disaster risks and disaster risks in Indonesia.

Table 5: Comparing citations authored in general and those first authored by Indonesian in 10 most cited papers (source: modified from SCOPUS results)

4 Conclusions and recommendations for future research

This paper has presented the results of a systematic literature review from Scopus to on the current research trends and progress related to natural hazards, disasters, and disaster risks reduction, as well as increasingly climate change impacts and governance in Indonesia. The paper also examines the roles of Indonesian authors and organizations in contributing to publications related to these topics. We have seen that some of the earliest publications were written in 1934 and publications started to increase rapidly since 2000. It is found there are more publications on HRD, than those on DRR and CC. Moreover, there are twice international authors for every Indonesian author and the contribution of international authors dominates the production of publications. Male and advanced career authors still dominate, compare to the numbers and roles of female and early career researchers (ECR). Most of the high impact publications and international collaborations were conducted with the key institutions centred on ITB, UGM, LIPI and PVMBG. In addition, there are very few researchers have social media accounts such as Google Scholar (Google, 2016a) or Research Gate (Research Gate, 2016b) or professional and personal websites.

The first part of the recommendations is related to future research topics. More research is needed on different hazards, different locations in Indonesia, and other topics in DRR and climate change. Majority of current research is still focused on geophysical hazards and those related to hydro-meteorological hazards have only received attention recently. Multi hazard, risks and vulnerability assessments are suggested. It has been seen that majority of research focuses on the Islands of Java and Sumatera. This is expected since both islands are the most at risks from natural hazards in Indonesia. However, other islands in Kalimantan, Sulawesi, Maluku and Papua in the eastern part of Indonesia have also been impacted by droughts, floods or strong winds and needs to be addressed in the future. The impacts of sea level rise on small islands, drought on forests in Kalimantan and Papua, raising sea level and ocean acidification on fisheries industry in Sulawesi and eastern part of Indonesia, are some of the increasingly worrisome issues expected from climate change. As the world is increasingly urbanized, there is strong international attention focusing and reducing risks in urban areas, in particular through concerted action in the New Urban Agenda (UN HABITAT, 2016). More research need to consider the context of urban areas by which social risks and risks from natural hazards play out simultaneously, and the impacts on urban dwellers needs to be understood. Cities in Indonesia like Jakarta, Surabaya or Makassar are rapidly urbanizing and environmental and economic pressures increase risks for the inhabitants (Firman et al., 2011; Larson et al., 2013; Santosa, 2000; Firman, 2016; van Voorst, 2016). Disaster risk governance has not received much research especially on the interplay with decentralization which places responsibility for DRR and risk management at the local government level (Lassa, 2013; Kusumasari et al., 2010). Strategies and actions for integrating DRR and CCA need to be explored further (Djalante and Thomalla, 2012; Lassa and Nugraha, 2015) There is still greater need for research on climate change topics related to linkages between poverty and disaster vulnerability (Suryahadi and Sumarto, 2003), security (CSIS, 2016), loss and damages (Warner et al., 2012), impacts on key sectors such as fisheries (USAID Indonesia, 2015), coastal communities (Marfai, 2014; Marfai et al., 2008), food security (Measey, 2012; WFP, 2015) health (Ady Wirawan, 2010; Haryanto, 2009), migrations (Raleigh et al., 2008; Reuveny, 2007), and community-based DRR (Heijmans, 2012). Many activities done by international and development agencies on their implementations for DRR or CCA

programmes have focused on the community level. There is abundance of activity reports by donor and international agencies (e.g. USAID, 2016; USAID Indonesia, 2011, 2015); however, those reports are rarely made available or submitted for academic publications. There is abundance of materials within Indonesian repositories related to bencana (Indonesia word for disaster), especially within the repositories at ITB, UGM, and University of Syiah Kuala in Aceh. These materials and research activities done within the universities need to be reviewed and submitted for international journals to give a broader view on issues that have been discussed by scholars in Indonesia.

The next recommendation is on the need to strengthen the capacity of research collaborations between Indonesian and international researchers, multi-disciplinary research and publications in high impacts journals. It is clear that some of the very limited Indonesian research from key universities doing disaster research such as the Bandung Institute of Technology (ITB), Indonesia Institute of Science (LIPI), the Gadjah Mada University (UGM) have been involved in international collaborations and publications of high impacts journal (QS, 2016). There are only nine universities in Indonesia that are within the list of QS World University Rankings, with University of Indonesia at the top of the list (QS, 2016). Other universities on the islands of Sumatra, Sulawesi, and Kalimantan and other locations need to address disaster issues as part of their research agendas (OECD and ADB, 2015). There is a need for better targeting of scholars to do more collaboration for research and writing for high impact journals. This goes along with strengthening the capacity of researchers and lecturers at the universities to write and publish in international journals. The Ministry of Education has indeed conducted a training scheme and provided incentives for lecturers that have published internationally (RISTEKDIKTI, 2016), however, the overall quality and quantity of papers by Indonesian researchers are still much less than those at comparable universities in Malaysia or Singapore (RISTEKDIKTI, 2016). The list from Scopus shows that there is still only small numbers of female and early career researchers (SCOPUS, 2016a). The first stage is to have proper identification of researchers and make this available to public. The author could not find a repository of researchers from the Ministry of Education website, let alone systematically determining their progress, history of schooling and research. There have been some concerns to strengthen the capacity of female researchers globally (Larivière et al., 2013), and also similarly in Indonesia. Early career researchers (ECR) are defined as those who are within 8 years after completing PhDs or within 6 years of trainings (AHRC, 2016). While globally there has been some systematic efforts to strengthen the capacity of ECR such as through mentoring (Clarke, 2004; Kram and Isabella, 1985), there are no clear strategies for the Indonesian ERC from the Indonesian governments. International journals (Elsevier, 2016) and international and other national research council (RCUK, 2016) have allocated resources and are funding research specifically for ECR. The Indonesian Association of Disaster Experts was formed in 2014 and meets annually to discuss their future research guidelines (IABI, 2016). One thing that should be on the agenda is to review current publications in Bahasa Indonesia and collaborations undertaken by Indonesian experts which can enable better identification of research progress and hence research needs in the future. There is increasing call for more inter-disciplinary collaborations so that complex problems on social and environmental issues can be understood better and problems identifications can better target those in needs (Future Earth, 2016). Hence this implies increasing importance of social science adoption to study disasters and their impacts. The roles of private business and the communities at risk have rarely been part of the research and collaborations. It is also not

clear how collaborations amongst scientists from social and physical backgrounds have taken place in Indonesia. It is also not clear how or whether science (Wagner and Leydesdorff, 2005a), policy and industry (Lee, 1996) collaborations have taken place and were documented in these listed publications. These collaborations are important to face the complexities of future problems (Leydesdorff and Wagner, 2008), and also to help achieve the outcomes of the Sustainable Development Goals

5 (United Nations, 2015).

In conclusion this study has been able to determine the progress in research related to natural hazards, risks, and risk reduction and climate change impacts in Indonesia. It has also been able to examine the roles of Indonesian scientists in collaborations and towards high quality publications. The recommendations are outlined toward these two issues and it is the responsibility both Indonesian and international organizations that have worked and will work in Indonesia to be able to meet the needs for

10 Indonesia to better understand, manage, and reduce its natural hazards and risks in the future and ultimately build a resilient and sustainable nation. [DR17]

Acknowledgment

The author would like to acknowledge her Alexander von Humboldt Fellowship for Experienced Researchers which facilitates her research visit (August 2015-July 2017) in Germany at the United Nations University Institute for Environment and Human
15 Security, Germany. She would like to thank Dr. Matthias Garschagen as the head of VARMAP section of UNU-EHS for his supports received during her research in Germany. The author benefits enormously from the reviewers' comments and has greatly improved to quality of the paper. As of August 2017, the author is based at the United Nations University Institute for the Advanced Study of Sustainability, Japan.

| | Exclusion | Topics <u>that are</u> too broad, e.g. mining, general climate science, minor mention or not directly on Indonesia | |

Table 72: Major research topics

| Major topics groups | Definitions (IPCC, 2012; UNISDR, 2009) | Number of publications (Percentage) |
|--|---|-------------------------------------|
| (1) Natural hazard, risks, disasters assessments (HRD) | Hazards: A dangerous phenomenon, substance, human activity or condition that may cause loss of life, injury or other health impacts, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage (UNISDR). Risks: The combination of the probability of an event and its negative consequences. Disaster: A serious disruption of the functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources (UNISDR). | 517 (56%) |
| (2) Disaster risk management or reduction (DRR) | The systematic process of using administrative directives, organizations, and operational skills and capacities to implement strategies, policies and improved coping capacities in order to lessen the adverse impacts of hazards and the possibility of disaster (UNISDR). The concept and practice of reducing disaster risks through systematic efforts to analyze and manage the causal factors of disasters, including through reduced exposure to hazards, lessened vulnerability of people and property, wise management of land and the environment, and improved preparedness for adverse events (UNISDR). | 210 (23%) |
| (3) Climate change vulnerability, impacts and | A change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods (UNFCCC). The adjustment in natural or human systems in response to actual or expected climatic | 194 (21%) |

| Major topics groups | Definitions (IPCC, 2012; UNISDR, 2009) | Number of publications (Percentage) |
|---------------------|---|-------------------------------------|
| adaptation (CC) | stimuli or their effects, which moderates harm or exploits beneficial opportunities (UNISDR). | |
| Total | | 921 |
