

## ***Interactive comment on “Meteorological analysis of flash floods in Artvin (NE Turkey) on August 24, 2015” by Hakki Baltaci***

### **Anonymous Referee #2**

Received and published: 11 May 2017

the study presented the unique topic in this location. while in this area has lots of flood or lanslide events, there is no investigation have been made in this area using meteorologic aspect. also the author investigated impact of sea water temperature, low moisture convergance objective on the flood and lanslides. and precipitaion values and model which used in this study were compared each other. this is important for the estimation. besides high density meteorologic network has increased last years in this area, and it enables spatial and temporally distribution.

under these conditions the study has topical, but some polish on grammer and English can be done. also floatation and rain background in this area can be presented with compare other national and international datas.
