Received and published: 29 November 2016

With the climate change and the rapid development of economy, the interrelationship among environmental change, development demand and rainfed agriculture is more and more complicated. This paper established a conceptual model of the agricultural drought adaptation mechanism, and analyzed the relationship among adaptation measure, development demand, and environment change using the empirical research method in a typical rainfed agricultural area in China. The results of this paper can provide references on measures and strategies for drought in other rainfed areas. This research is very meaningful. I suggest it is accepted for publication. Âă
