

1 **Reviewer #1**

2
3 I understand that the aim of the Authors is to analyse the results of the survey and that the
4 article is not focused on the phenomenon “per se”, nevertheless I think that they presume that
5 all the readers know about it, while this is not true. For example, describing figure 2 they
6 assume that all the readers know what are the most dangerous sectors, but it is not true instead
7 (or it is not for me that only know Mediterranean Sea and swimming pools). Maybe some notes
8 in the caption of figure 2 could avoid that a reader having no experience with this type of
9 phenomenon does not understand its importance and only
10 can appreciate the correct scientific analysis of data.

- 11
12 • We agree with the reviewer that this level of detail is
13 a needed in the revised manuscript. Specifically, we
14 added notations to Figure 2 to identify the safe and
15 unsafe areas in each picture, including the location of
16 the rip current in each photograph. An additional
17 annotation will be added to the Figure heading to let
18 readers know that the annotation was not included
19 in the original survey. As described further below, we
20 have also added a section to the Introduction that
21 describes rip currents in more detail. We have also
22 added simple statements throughout the revised
23 manuscript that help provide a basic understanding
24 of rip currents.

25
26 **Fig. 2.** Photographs used in Questions 42 through 44
27 of the survey to ask respondents “Where on this photograph would you swim?”. The
28 location of the rip current in each photograph is shown by the red arrow, which was not
29 visible to the respondents. In these examples, rip current location can also be identified by
30 areas of reduced wave breaking.

31
32 **The same impression reading the section Forecast. The Authors should first give clear**
33 **information on the “right message”, the right definition of high/low risk and then present the**
34 **different people answers. In my opinion, this lack of information can generate confusion and**
35 **obstruct a complete comprehension of the importance of the different answers.**

- 36
37 • The question raised by the reviewer represents one of the problems with the current
38 warning systems for rips - there is no ‘right message’ for the definition of high or low risk.
39 The forecast used by different agencies and in different areas are not consistent (as
40 discussed on page 6, line 141 in the original manuscript), which means that it is not
41 possible to identify the ‘right message’ for readers. However, we have added several
42 statements (see below) to the results section on forecasts to remind the reader that there
43 is no ‘right message’ and that we are only concerned about whether the respondent
44 believed the message to be consistent with their observations.

.....The lack of consistency in forecasting is complicated by rip development being dependent on how the incident wave field interacts with the pre-existing nearshore morphology, which is difficult to predict without local knowledge on how it evolves over a range of spatial and temporal scales.

Since perception of the rip hazard depends in part on trust in experts and authorities, and trust in the protective measures they employ (Njome et al., 2010; Heitz et al., 2009; Terpstra, 2009, 2011; Barnes, 2002), inaccuracies in the forecast or a discrepancy between the forecast and what is observed at a specific beach at a specific time can erode confidence in the forecast (Siegrist and Cvetkovich, 2000; Espluga et al., 2009). A lack of confidence in the forecast could potentially condition beach users to downplay the hazard warning on future visits (Hall and Slothower, 2009; Scolobig et al., 2012; Green et al., 1991; Mileti and O'Brien, 1993).....

Respondents were also asked about whether they were aware of forecasts and whether those forecasts altered their behavior, and if the forecasts conformed with their observations at the beach. Since forecasts are not consistent and few are based on an understanding of the pre-existing morphology, we were not worried about whether the forecast was accurate, and focused on whether the respondent believed the message to be consistent with their observations.

The problem lies in the fact that rip forecasts tend to be overly general to a larger region and time and not necessarily dependent on an understanding of the pre-existing morphology...

Moreover, it is difficult to predict the potential for rip development without an understanding of the pre-existing nearshore morphology that is difficult to predict without local knowledge on how it evolves over a range of spatial and temporal scales.

The Authors, in my opinion, are too much focused on the results of their analysis and neglect to consider that not all the readers know the analysed phenomenon.

- We have added a section in the introduction that describes rips in more detail and explain their formation. This will be combined with the suggestion by Reviewer #2 to describe how rip forcing and behavior may vary in different regions.

Rip currents (often called “rips” or “rip tides”) are strong, narrow seaward flows driven by alongshore variations in wave breaking and resulting wave set-up landward of the breaker zone. Due to their dependence on wave breaking, rips can develop in any beach environment in oceanic, sea and lacustrine environments. Castelle et al. (2016) classify rips as: 1) boundary rips that develop along both natural and engineered structures including headlands, groins and piers, 2) bathymetric rips that develop in response to variability of the nearshore morphology; and 3) hydrodynamic rips that are

89 *spatially and temporally variable and develop in the absence of morphological variations*
 90 *or a lateral boundary. The type of rip that develops on a beach depends on the local wave*
 91 *climate and geology. For example, rips in the Great Lakes tend to be associated with*
 92 *natural headlands or the presence of large groins or harbor jetties, while rips in Florida*
 93 *and Texas tend to be bathymetrically controlled and associated with a transverse bar and*
 94 *rip nearshore morphology (Houser et al. 2013). Rips also vary regionally based on the*
 95 *driving forces, with rips on the Great Lakes typically associated with moderate to strong*
 96 *winds, while on the West Coast of the United States, rips are often associated with large*
 97 *swell events independent of the wind.*

98 *Rips are capable of carrying unsuspecting bathers significant distances away from*
 99 *the shoreline with speeds reaching over 2 m s⁻¹. As a consequence rips are considered a*
 100 *major public health problem in the USA....*

101
 102 **The paper is very fluent, but also very long and not schematic. I think that a further effort**
 103 **should be done to summarise the main results of each paragraph in a table for each paragraph,**
 104 **and also in a general table summarising all the findings in the discussion. Otherwise, as the**
 105 **paper is structured, the reader can not perceive each of the results obtained. Considering that**
 106 **this paper should be the starting point of an improvement of the Campaign, I think that the**
 107 **results should appear more clearly from the paper, in form of a list of bullets.**

- 108
- 109 • This is a very good suggestion that will help to summarize the main findings from each
- 110 section. We have added a table to the beginning of the discussion section.
- 111

112 **Table 2.** Summary of major findings from the “Break the Grip of the Rip!” National Rip Current
 113 Survey.

Focus of Questions	Example topics
Beach Preference	<ul style="list-style-type: none"> • Frequency and purpose of visits to a beach affect perception of surf conditions, importance of swimming near a lifeguard and self-reported ability to spot a rip current
Swimming Ability	<ul style="list-style-type: none"> • Range of self-reported swimming ability (distance in open water) related to self-reported competency
Ability to Identify a Rip Current	<ul style="list-style-type: none"> • Ability to identify safest location in a photograph related to frequency of beach visits, self-reported swimming competency and training • Ability to identify safest location related to perceived importance of and concern about surf hazards, self-reported understanding of “high” and “low” risk conditions, and perceived accuracy of rip forecasts

Response to Warning Sign

- Perceived ability to use sign to identify a rip current varied with ability to identify safest location on a photograph
- Sign has been effective in communicating swimming parallel as an escape strategy, and taking caution when entering the water

Prevention

- Identified need to provide a more accurate depiction of a rip current, detailed instructions on how to escape a rip current, and local emergency information
- “Break the Grip of the Rip” Campaign has been successful in informing beach users to: 1) not fight the current; 2) swim out of the current, then to shore; 3) if you can’t escape, float or tread water; and 4) if you need help, call or wave for assistance

Forecasts

- Self-reported change in behavior based on forecasted beach and surf conditions, but tendency for forecasts to be inconsistent with observations
- Perceived inaccuracy of forecast related to spatial and temporal broadness of forecast, inability to identify a rip, and behavior of other beach users

Trusted Sources of Information

- No significant correlations were observed between trust in a source of information and respondent demographics

115

116 **Figure 2: The authors have the answer in mind but also the**
117 **readers would like to know it.**

118

- As noted above, we added notations to Figure 2 to show the location of safe and unsafe swimming areas, as well as the location of the rip current in each photograph.

123

124 *Fig. 2. Photographs used in Questions 42 through 44*
125 *of the survey to ask respondents “Where on this*
126 *photograph would you swim?”. The location of the rip*
127 *current in each photograph is shown by the red arrow,*
128 *which was not visible to the respondents.*

183 Reviewer #2

184

185 There is no section that focusses on familiarity with the “break the grip’ program itself and it
186 might be useful to tackle this first and then go on to the detailed analysis.

187

188 • This is a valid criticism and we have added a section about the “break the grip’ program
189 at the start of the results section and use that as an introduction to the other results.

190

191 **3.1 Familiarity with the Break the Grip of the Rip[®] Campaign**

192 *Only 18% (n=304) of respondents reported hearing about the Break the Grip of the Rip[®]*
193 *Campaign with a nearly identical split by gender and age. Of those who did,*
194 *approximately 40% reported hearing about the campaign either through a*
195 *brochure/pamphlet (n=120) or at the entrance to a beach (n=119). The majority of*
196 *respondents (54%; n=163) reported hearing about the campaign through various sources*
197 *on the internet including 90 respondents who reported having heard about the campaign*
198 *from the Break the Grip of the Rip[®] website itself. When asked what Break the Grip of*
199 *the Rip means, most respondents (familiar with the campaign) reported (to varying*
200 *degrees of accuracy) that it was designed to provide information about what to do if*
201 *caught in a rip current:*

202

*Do not try to fight the current, instead work with the current
until you can break free of its pull*

205

*Advises affected swimmers not to struggle while heading shoreward
but to swim parallel to the beach till out of the off-beach current*

208

Swim parallel to get out of the rip

210

211 *There were, however, several respondents (familiar with the campaign) who believed*
212 *that the messaging was not appropriate and needed to be rethought:*

213

The slogan is useless to anyone caught in a rip current!

215 *What can you do by knowing this slogan?"Wave, Yell & Swim Parallel"*

216 *is a far better slogan...it provides 3 lifesaving pieces of information. The existing slogan*
217 *provides nothing.*

218

it's an advertising slogan; it doesn't mean much at all.

220 *It's a bad slogan; it does not tell folks what to do,*

221 *what to watch for, or anything useful.*

222

223 *Responses from those who were not familiar with the campaign were much shorter and*
224 *did not contain the level about survival strategies provided by those familiar with the*
225 *campaign. Representative responses include “how to escape”, “tips to survive”, and “how*
226 *to get out of a rip”.*

In support of this new section we added to the introduction and the discussion:

Results from Brannstrom et al. (2015) suggest that while most beach users in Texas were not familiar with the campaign itself, many were familiar with a key message of the campaign on “what to do” when caught in a rip current. This suggests that the campaign may have been successful in educating beach users and reducing the number of drownings, but this hypothesis has never been formally tested.

Results of this rip current survey suggest that while many potential US beachgoers are not aware of the “Break the Grip of the Rip” ® campaign, those that are tend to be informed about rip current safety. While this is an encouraging result, it needs to be placed in context.

It is also interesting to note that while many survey respondents were not familiar with the “Break the Grip of the Rip” ® campaign itself, a clear majority of respondents (~91%) understood the primary message of the campaign and were able to provide an explanation of the message (i.e. “break the grip”), with those previously familiar with the campaign providing detailed explanations of how to escape by ‘swimming parallel’ and/or ‘floating until the current weakened’. This also indicates that respondents may also have gained this knowledge from other sources.

The results section is a little lengthy and could be shortened a bit by confining the quotes to one or two per section since they are provided purely for illustration.

- We included as many quotes as possible to ensure that we provided as much context and detail as possible for the readers. However, we recognize that there are large number of quotes and that they are only used for illustration. In this respect, we have reduced the number of quotes in the results section by a third.

The discussion is quite lengthy, but serves a useful purpose in drawing out the relevant messages from the survey itself and especially the contrast between frequent visitors, who were knowledgeable of the hazard, and infrequent visitors who were not knowledgeable and therefore likely to be most at risk. However, the key take-home messages in the discussion are not always apparent and it might be better to make them clearer in the conclusions by presenting them (the conclusions) as a set of concise bullet points that bring out the key results and recommendations rather than as a lengthy paragraph.

- This is consistent with the comments of Reviewer #1, and we have therefore added a table at the start of the discussion section to highlight the most important findings presented in the results section. Because we have added this table, we maintained the structure of the conclusion section with a broad summary and a focus on what can be done to improve the campaign and forecasting.

271 **Table 2.** Summary of major findings from the “Break the Grip of the Rip!” National Rip Current
 272 Survey.

274
 275
 276

277 The authors note in the introduction that the US has 4 coastlines (presumably the Arctic coast
278 is omitted because of limited swimming opportunities) and that they differed considerably in
279 terms of wave climate and beach systems. They also differ in the role of winds in generating or
280 exacerbating the hazard. Thus, on the Great Lakes rip currents always occur in the presence of
281 moderate to strong winds while on the west coast rip currents are often associated with large
282 swell events and wind may be light. In the Great Lakes most rip current deaths appear to be
283 associated with natural headlands, or with the presence of large groynes or harbour jetties but
284 in Florida or Texas this is probably not the case. It might be useful therefore to comment on
285 whether there were differences in responses based on which coast people used and to assess
286 whether the education program should be tailored to individual coasts.

287

- 288 • In response to Reviewer #1 we will add to the introduction to describe rip currents and
289 will use this section to describe the differences in the rip problem amongst the different
290 coasts. While there is not enough information to determine whether location had an
291 influence on the responses, we will add this as a qualifier and possible complicating factor
292 in the discussion section.

293

353 **Abstract**

354

355 Rip currents pose a major global beach hazard; estimates of annual rip current related deaths in the
356 United States alone range from 35 to 100 per year. Despite increased social research into beach-
357 goer experience, little is known about levels of rip current knowledge within the general
358 population. This study describes results of an online survey to determine the extent of rip current
359 knowledge across the United States, with the aim of improving and enhancing existing beach
360 safety education material. Results suggest that the US-based “Break the Grip of the Rip”®
361 campaign has been successful in educating the public about rip current safety directly or indirectly,
362 with the majority of respondents able to provide an accurate description of how to escape a rip
363 current. However, the success of the campaign is limited by discrepancies between personal
364 observations at the beach and rip forecasts that are broadcasted for a large area and time. It was
365 the infrequent beach user that identified the largest discrepancies between the forecast and their
366 observations. Since infrequent beach users also do not seek out lifeguards or take the same
367 precautions as frequent beach users, it is argued that they are also at greatest risk of being caught
368 in a dangerous situation. Results of this study suggest a need for the national campaign to provide
369 greater focus on locally specific and verified rip forecasts and signage in coordination with
370 lifeguards, but not at the expense of the successful national awareness program.

371

372 **KEYWORDS:** Rip Current, Beach Safety, Survey, Perceived Risk

373

374

375

376

377

378 **1 Introduction**

379

380 Rip currents (often called “rips” or “rip tides”) are strong, narrow seaward flows driven by
381 alongshore variations in wave set-up landward of the breaker zone. Due to their dependence on wave
382 breaking, rips can develop in any beach environment in oceanic, sea and lacustrine environments.
383 Castelle et al. (2016) classify rips as: 1) boundary rips that develop along both natural and engineered
384 structures including headlands, groins and piers, 2) bathymetric rips that develop in response to the
385 variability of the nearshore morphology and 3) hydrodynamic rips that are spatial and temporally
386 variable and develop in the absence of morphological variations or a lateral boundary. The type of rip
387 that develops on a beach depends on the local wave climate and geology. For example, rips in the Great
388 Lakes tend to be associated with natural headlands or the presence of large groins or harbor jetties,
389 while rips in Florida and Texas tend to be bathymetrically controlled and associated with a
390 transverse bar and rip nearshore morphology (Houser et al. 2013). Rips also vary regionally based
391 on the driving forces, with rips on the Great Lakes typically associated with moderate to strong
392 winds, while on the West Coast of the United States the rips are often associated with large swell
393 events independent of the wind.

394 Rips are capable of carrying unsuspecting bathers significant distances away from the shoreline
395 with speeds reaching over 2 m s^{-1} . As a consequence rips are considered a major public health
396 problem in the USA, Australia, Costa Rica, and many other countries (Klein et al., 2003;
397 Hartmann, 2006; Sabet and Barani, 2011; Woodward et al., 2013; Arun Kumar and Prasad, 2014).
398 Rip currents in these countries are considered a major public health problem (Short and Hogan
399 1994; Sherker et al., 2008; Morgan et al. 2009; Arozarena et al., 2015). In Australia, rip currents
400 are believed to be responsible for approximately 13,000 beach rescues per year (SLSA, 2016) and
401 an average of 21 confirmed deaths per year (Brighton et al., 2013), which exceeds fatalities caused

402 by most other natural hazards (Brander et al., 2013). While it has been estimated that 30–40
403 individuals drown each year in rip current related incidents in the United States (Gensini and
404 Ashley 2010), Lushine (1991) suggested that rips may account for up to 150 fatal drownings per
405 year and the United States Lifesaving Association (USLA) estimate this number to be over 100
406 per year. USLA’s National Lifesaving Statistics Report (2012) indicates that over 82% of surf
407 beach rescues in the US are rip current related and they therefore surmise that 82% of all fatal
408 drownings at beaches are associated with rip currents.

409 Beach users’ vulnerability to drowning in a rip current depends on a combination of
410 nearshore hydrodynamic and bathymetric conditions, personal and group behaviors, and the beach
411 safety and rip current knowledge of the individual (e.g. Houser et al., 2011; Brander et al., 2011;
412 Caldwell et al., 2013; Houser et al., 2016). Morgan et al. (2009) identified that lacking rip current
413 knowledge was associated with rip current drownings, as was gender, age, alcohol consumption,
414 and overconfidence in swimming ability. Recent evidence suggests that while most beach users
415 are aware of rip currents and the hazard they pose, they are not able to identify a rip current
416 (Sherker et al., 2010; Caldwell et al., 2012; Brannstrom et al., 2014). More than 80% of beach
417 users surveyed in Florida and Texas failed to identify rip currents in photographs, usually by
418 incorrectly identifying areas of breaking waves as the most hazardous swimming conditions
419 (Brannstrom et al., 2014). This is consistent with results of Sherker et al. (2010) who argued that
420 most beach users are unable to identify a rip current and that “beachgoers clearly need to know
421 what a rip looks like to actively avoid swimming in it” (pg. 1787). Given sufficient information, it
422 is possible for beach users to identify a rip current with confidence (Hatfield et al., 2012). However,
423 the ability to identify a rip current or to recognize posted warnings about the rip current danger is
424 not a guarantee that a beach user will be safe, particularly because many will still choose to swim

425 in unsafe and unpatrolled sections of the beach, away from the presence of lifeguards, for social
426 or behavioral reasons or because of lack of awareness and/or complacency (Drozdewski et al.
427 2012; 2014; Williamson et al. 2012; Houser et al., 2016). Recent evidence suggests that beach
428 access management can inadvertently steer unsuspecting beach users towards rip-prone areas,
429 increasing the chances of a drowning occurring on that beach (see Barrett and Houser, 2012;
430 Houser et al., 2015; Trimble and Houser, 2017).

431 Informing the public about the rip current hazard has become a national priority in several
432 countries including the United States (e.g. Ashley and Black, 2008; Brannstrom et al., 2013),
433 Australia (e.g. Sherker et al., 2008; Brighton et al., 2013), United Kingdom (e.g. Woodward et al.,
434 2013), and Costa Rica (Aronzarena et al., 2015). The United States has arguably the longest
435 running cooperative and coordinated public rip current education program operating across various
436 organizational and political levels (Carey and Rogers, 2005). A Rip Current Task Force was
437 convened in 2003 by the National Oceanic Atmospheric Administration (NOAA) and United
438 States Lifesaving Association (USLA) to establish consistent rip current education efforts and
439 improve data sharing about rip current rescue data across the United States. Subsequently, with
440 the assistance of the National Weather Service (NWS) and Sea Grant, a national “Break the Grip
441 of the Rip!” ® education campaign was initiated in 2004. The “Break the Grip of the Rip!” ®
442 campaign aimed to educate the public about the rip current hazard by providing information about
443 what rip currents are, why they are dangerous, how to identify them, what to do if caught in one,
444 and how to help someone else if they are caught in a rip current. Aspects of this information have
445 been disseminated through various means such as the NWS Rip Current Safety webpage
446 (<http://www.ripcurrents.noaa.gov/>), brochures, beach signs, videos, newspaper articles, and public
447 service announcements on television.

448

449 While this campaign was the first of its kind globally, it was also particularly challenging given
450 that the United States has four very different coastlines (West Coast, East Coast, Gulf Coast, Great
451 Lakes) that differ in terms of wave climate and beach systems, and a large inland non-coastal
452 population who may only visit any of these coastlines infrequently. Results from Brannstrom et
453 al. (2015) suggest that while most beach users in Texas were not familiar with the campaign itself,
454 many were familiar with a key message of the campaign on “what to do” when caught in a rip
455 current. This suggests that the campaign may have been successful in educating beach users and
456 reducing the number of drownings, but this hypothesis has never been formally tested.

457 The core visual image used in many of these interventions was a simple diagrammatic
458 illustration of an idealized rip current from an oblique aerial perspective (Fig. 1). In this image,
459 the rip current is characterized by relatively calm white water surrounded by more intensive wave
460 breaking adjacent to the rip and close to the shoreline. An image template was created that could
461 be accessed online and in hardcopy and duplicated freely to be posted along boardwalks,
462 beachfronts and public beach access points throughout the United States. The image has also been
463 more recently adopted in other countries such as Thailand, Costa Rica, Mexico, South Korea, and
464 Japan. While the NOAA-USLA sign was not intended to teach the general population to identify
465 a rip, the prominent image of a rip current on the sign and attempts to post the sign on beaches
466 indicate that its function and visual argument constitute an invitation to beach users to use the
467 information to identify rip currents (Brannstrom et al., 2015).

468 Due to this conflict between its’ theoretical and practical use, the NOAA-USLA rip current
469 sign has proven to be mostly successful in regards to educating beachgoers on “what to do” (e.g.
470 swim parallel to the beach) when caught in a rip current, but has not been particularly successful

471 in improving beach users' ability to identify rip currents from the perspective of standing or sitting
472 on the beach (Brannstrom et al., 2015). Consistent with results of Matthews et al. (2014), only a
473 small percentage of beach users (<50%) recalled observing rip current warning signs on beaches
474 in Florida and Texas (Caldwell et al., 2012; Brannstrom et al., 2014) despite their wide spread
475 occurrence at beach access points. However, it is important to note that despite observing and
476 understanding a warning sign, it is well established that some people will not take the appropriate
477 actions to prepare for or avoid the hazard (Sietgrest and Gutscher, 2006; Karanci et al., 2005; Hall
478 and Slothower, 2009; Johannesdottir and Gisladdottir, 2010).

479 In a separate initiative, the NWS has endeavored to develop a public rip current forecasting
480 system, although the methodology varies among Weather Forecast Offices (WFO). Some WFOs
481 issue surf zone forecasts that include a 3-tiered (low, moderate, high) rip current outlook
482 communicated to the public during television and radio news broadcasts (Carey and Rogers, 2005)
483 and social media platforms. Some WFOs work with local lifeguards to update their outlooks based
484 on real-time observations. However, as discussed in NOAA (2015), these forecasts are not
485 necessarily communicated or disseminated in a consistent manner throughout all regions and
486 therefore, are not communicated seamlessly. The lack of consistency in forecasting is complicated
487 by rip development being dependent on how the incident wave field interacts with the pre-existing
488 nearshore morphology, which is difficult to predict without local knowledge on how it evolves
489 over a range of spatial and temporal scales.

490 Since perception of the rip hazard depends in part on trust in experts and authorities, and
491 trust in the protective measures they employ (Njome et al., 2010; Heitz et al., 2009; Terpstra, 2009,
492 2011; Barnes, 2002), inaccuracies in the forecast or a discrepancy between the forecast and what
493 is observed at a specific beach at a specific time can erode confidence in the forecast (Siegrist and

494 Cvetkovich, 2000; Espluga et al., 2009). Lack of confidence in forecasts could potentially
495 condition beach users to downplay the hazard warning on future visits (Hall and Slothower, 2009;
496 Scolobig et al., 2012; Green et al., 1991; Mileti and O'Brien, 1993). Furthermore, the generic
497 nature of the rip current forecasts can result in situations where the actual intensity of rips varies
498 substantially from the forecast. Beachgoers could easily observe a discrepancy between their beach
499 location and the rip forecast, caused by either the generalized nature of the forecast or their inability
500 to identify a rip current (Caldwell et al., 2012; Brannstrom et al., 2014, 2015).

501 The national US rip current education program is clearly an impressive effort yet many rip
502 current related fatalities and rescues still occur on US beaches and overseas (Gensini and Ashley
503 2010) and there is little quantitative evidence available to assess the overall effectiveness of the
504 program. This is largely because no ‘pre-program’ study was conducted on public understanding,
505 perception, or behavior in relation to the rip current hazard. There is also a lack of hard data on rip
506 current related fatalities, beach visitation numbers and how incident frequency and exposure rate
507 may have changed over time. In this regard, NOAA sponsored a workshop in 2015 to review the
508 “Break the Grip of the Rip” ® program and NWS rip current forecasts to discuss whether existing
509 messaging is scientifically sound, as well as effective and clear in reaching all age groups and
510 demographics (NOAA, 2015).

511 It was acknowledged at the NOAA workshop that while there have been several recent
512 studies to describe the extent of rip current knowledge amongst beach users (or lack thereof) on
513 specific beaches in the United States (Caldwell et al., 2013; Brannstrom et al., 2014, 2015) there
514 is insufficient understanding about beach user knowledge of rip currents and their behavior at the
515 beach at a national level. This study describes results of a national online survey focused on United
516 States based beachgoers and their understanding of, and experience with, the “Break the Grip of

517 the Rip” ® program and the rip current hazard to provide quantitative evidence to guide future
518 improvements to beach safety education material and forecasting efforts.

519
520 **2 Methodology**

521
522 The study research design relied on an internet-based survey instrument using Qualtrics
523 approved by the relevant human subject protection program from Texas A&M University. The
524 survey consisted of questions re-phrased from Sherker et al. (2010) and photograph-based rip
525 current identification protocols (Fig. 2) modified from Brannstrom et al. (2014, 2015), with
526 questions grouped into six categories (Table 1). The survey had 75 questions and took
527 approximately 20-30 minutes to complete. It remained open from May-August 2015 and all
528 answers were recorded anonymously through Qualtrics Survey Software. A copy of the survey
529 instrument is provided as an appendix to this manuscript.

530 The survey was distributed by email to cooperating organizations and individuals for
531 distribution though listservs, websites, social media and in advertisements. In particular, it was
532 disseminated via secure Internet and social media links for Texas A&M University, Sea Grant,
533 Science of the Surf, NWS, and the National Oceanic and Atmospheric Association (NOAA).
534 While this internet-based recruitment process attempted to target a much wider demographic of
535 the US population, it is also reasonable to assume that as the host websites were all beach and surf-
536 related, survey respondents likely had greater interest in, and understanding of, coastal
537 environments and hazards leading to a potential bias that was also experienced in a beach safety
538 related study by Drozdzweski et al. (2012).

539
540 **3 Results**
541

542 Between May and August 2015, a total of 2084 respondents started the online survey, but
543 only 1622 completed all questions (completion rate: 78%). Geographically, the largest number of
544 respondents were from the state of Texas (n=368) where Texas Sea Grant and the local NWS office
545 conducted significant advertisement for the survey. Large numbers of respondents also came from
546 North Carolina (n=214), California (n=184), and Florida (n=130), with most remaining states
547 having <50 respondents. Of the 50 US states, only Nebraska did not have a respondent. Overall
548 this cohort managed to capture respondents who use each of the coastlines in the continental US.
549 Respondents were evenly distributed by age (>18 years); each 10-year range between 21 and 60
550 garnered about between 320 and 420 respondents. A slight majority of the respondents were female
551 (55%).

552

553 **3.1 Familiarity with the Break the Grip of the Rip ® Campaign**

554 Only 18% (n=304) of respondents reported hearing about the Break the Grip of the Rip ®
555 Campaign with nearly identical split by gender and age. Approximately 40% of respondents
556 reported hearing about the campaign either through a brochure/pamphlet (n=120) or at the entrance
557 to a beach (n=119), whereas 163 respondents (54%) reported hearing about the campaign through
558 various sources on the internet. 90 respondents reported having heard about the campaign from
559 the Break the Grip of the Rip ® website. When asked what Break the Grip of the Rip means, most
560 respondents (familiar with the campaign) reported (to varying degrees of accuracy) that it was
561 designed to provide information about what to do if caught in a rip current:

562 *Do not try to fight the current, instead work with the current*
563 *until you can break free of its pull*

564

565 *Advises affected swimmers not to struggle while heading shoreward*
566 *but to swim parallel to the beach till out of the off-beach current*

567

568 There were, however, several respondents (familiar with the campaign) who believed that the
569 messaging was not appropriate and needed to be rethought:

570 *The slogan is useless to anyone caught in a rip current!*
571 *What can you do by knowing this slogan?"Wave, Yell & Swim Parallel"*
572 *is a far better slogan...it provides 3 lifesaving pieces of information. The existing slogan*
573 *provides nothing.*

574
575 *it's an advertising slogan; it doesn't mean much at all.*
576 *It's a bad slogan; it does not tell folks what to do,*
577 *what to watch for, or anything useful.*
578

579 Responses from those who were not familiar with the campaign were much shorter and did not
580 contain the level about survival strategies provided by those familiar with the campaign.
581 Representative responses include “how to escape”, “tips to survive”, and “how to get out of a rip”.

582

583 **3.2 Beach Preference**

584

585 As presented in Fig. 3, most respondents visited the beach either once per year on vacation
586 (22%) or multiple times per year (42%). Visitation exhibits a statistically significant relationship
587 with age, with older respondents (>40) visiting the beach more often than younger respondents
588 ($\chi^2=46.5$, $p<0.01$). Perceived wave size on beaches visited by respondents depends on age and
589 frequency of beach visitation with older respondents who visit the beach frequently tending to
590 report beaches they visited having strong waves, while younger respondents, who tended to visit
591 the beach infrequently, identified the beach as having small waves ($\chi^2=84$, $p<0.01$). In general,
592 respondents who visit the beach infrequently tend to describe the beach as having small waves and
593 that their primary beach activity is swimming and/or wading. All respondents who visit the beach
594 frequently (weekly or daily) identified board riding as their main activity and tended to frequent
595 beaches with strong wave activity ($\chi^2=111$, $p<0.01$), suggesting a greater understanding of wave

596 conditions. There was no statistically significant variation in wave description based on home state,
597 suggesting that perception of wave activity is largely based on frequency of beach visitation and
598 other personal characteristics. In terms of choice of beach visited, wave activity and the potential
599 hazard posed by rip currents or the absence of lifeguards is less important than cleanliness and at
600 the same level of importance as crowds (Fig. 4).

601 When determining which beach to visit, frequent beach users, who were mostly board
602 riders, tended to prefer beaches with lots of waves, whereas infrequent users emphasized safety
603 and cleanliness ($\chi^2=159$, $p<0.01$). Frequent beach users also believed it was very important to swim
604 near a lifeguard, while infrequent users did not ($\chi^2=51$, $p<0.01$). Across both groups, however,
605 respondents suggested they would still enter the water even if a lifeguard was not present,
606 suggesting that recognition about the importance of lifeguards is not consistent with behavior in
607 selecting where and when to swim (Fig. 5). Frequent beach visitors were also more confident in
608 their ability to ‘always’ spot a rip current in contrast to infrequent beach visitors ($\chi^2=247$, $p<0.01$).
609 Those who visit the beach less often (e.g. several times per year or month) believed they could
610 spot a rip ‘sometimes’ or believed it is not possible to see a rip current, consistent with the response
611 from all respondents (Fig. 6).

612 613 **3.3 Swimming Ability** 614

615 Most respondents (~52%) self-identified as competent swimmers (Fig. 7) and reported in
616 a separate question that they were capable of swimming between 25 and 100 yards (or more than
617 100 yards) without having to stop or pause in open water ($\chi^2=1391$, $p<0.01$). Respondents who
618 self-reported as *highly* competent open water swimmers (n=213, 12%) primarily believed they
619 could swim more than 500 yards in open water without resting, while those who self-reported as
620 weak swimmers (n=566, 31%) believed that they were only capable of swimming 25 yards or less.

621 Those who identified as highly competent or weak swimmers tended to have the narrowest range
622 of self-reported ranges of swimming ability, while those who self-identified as competent
623 swimmers had the widest range of self-reported swimming distances for both pools and open
624 water.

625 626 **3.4 Ability to Identify a Rip Current** 627

628 When asked “Where on this photograph would you swim?”, approximately 54% of
629 respondents correctly identified the location furthest away from the rip current in Photograph 1
630 (Figs. 2a and 8a). However, 182 (11%) respondents incorrectly selected the rip current as the safest
631 location to enter the water, with the remaining respondents identifying other areas of the
632 photograph (adjacent to the rip) as being the safest location. Results of a z-test suggest that
633 respondents who selected the rip as the safest location are significantly younger than those who
634 correctly identified the safest location in the photograph ($z=12.1$, $p<0.01$). Those who correctly
635 identified the safest location in the photograph also visited beaches more frequently ($z=6.1$,
636 $p<0.01$) and self-reported beaches they visited as having strong waves ($z=6.4$, $p<0.01$). Most
637 respondents who identified the rip as the safest location self-reported never having swimming
638 lessons ($z=2.8$, $p<0.01$) and described themselves as weak swimmers in both pools ($z=3.7$, $p<0.01$)
639 and open water ($z=6.2$, $p<0.01$). Those same respondents also self-reported that it was important
640 to swim near a lifeguard ($z=5.8$, $p<0.01$), but tended to not consider hazards before going to the
641 beach, unlike respondents who were able to correctly identify the safest spot to enter the water
642 ($z=14.1$, $p<0.01$).

643 When asked what beach features they believed to be most dangerous, respondents who
644 correctly identified the safest swimming location away from the rip were more likely to report
645 alongshore currents and rip currents as dangerous features, while those who selected the rip as the

646 safest location tended to identify jellyfish, sharks, and big waves. Respondents who incorrectly
647 selected the rip current as the safest location were also least familiar with the common US beach
648 safety flag system ($z=11.5, p<0.01$), and tended to have not heard of rip currents ($z=17.3, p<0.01$).
649 Respondents who selected the rip as the safest location did not understand what was meant by a
650 “high risk” ($z=3.2, p<0.01$) or a “low risk” ($z=7.5, p<0.01$) of rip current development as broadcast
651 by some NWS services. The same respondents also noted that rip forecasts are apt to be
652 inconsistent with the conditions they encountered on the beach, in contrast to respondents who
653 correctly identified the safest location in the photograph and noted that forecasts tended to be
654 consistent with their experience ($z=3.3, p<0.01$).

655 Approximately 25% of respondents ($n=630$) incorrectly identified the left side of the groin
656 (with an active rip) as the safest spot to enter the water in Photograph 2 (Figs. 2b and 8b). Like the
657 responses to Photograph 1, those respondents tended to be younger ($z=5.2, p<0.01$), go to the beach
658 infrequently ($z=7.8, p<0.01$), and self-report waves being relatively small ($z=7.3, p<0.01$) and their
659 swimming ability in open water to be relatively poor ($z=2.2, p<0.01$). These respondents are also
660 unlikely to consider hazards before going to the beach ($z=10.9, p<0.01$), are unfamiliar with the
661 common beach flag system in the United States ($z=12.5, p<0.01$), do not understand the definition
662 of a “high-risk” of rip current development ($z=4.2, p<0.01$), and believe that rip forecasts are not
663 consistent with their personal beach experiences ($z=2.8, p<0.01$). Unlike responses for Photograph
664 1, those respondents who incorrectly identified the rip as the safest location were not significantly
665 different (at the 95% confidence level) from those who correctly identified the safest location (right
666 side of the groin) with respect to: pool swimming, swimming near a lifeguard, type of water
667 activity at the beach, knowledge of the “*Break the Grip of the Rip*” ® campaign, or their perceived
668 ability to use the sign to identify a rip current.

669 A similar pattern was observed in respondent' ability to identify the safest location to enter
670 the water in Photograph 3 (Figs. 2c and 8c), with 26% of respondents incorrectly identifying the
671 rip current as the safest location. Like responses for the other photographs, respondents who
672 identified the rip as the safest location to enter the water did not visit beaches as often ($z=4.5$,
673 $\rho<0.01$), self-reported having relatively limited swimming ability in pools ($z=3.1$, $\rho<0.01$) and
674 open water ($z=2.8$, $\rho<0.01$), and did not believe it was important to swim near a lifeguard ($z=3.0$,
675 $\rho<0.01$), unlike those who correctly identified the safest location to enter the water in the
676 photograph. Respondents who selected the rip current as safe for swimming were not as familiar
677 with the flag system used in the United States ($z=5.6$, $\rho<0.01$), rip currents ($z=3.9$, $\rho<0.01$), or the
678 “*Break the Grip of the Rip*” ® campaign ($z=4.4$, $\rho<0.01$). These respondents also did not
679 understand what was meant by a “low risk” ($z=2.5$, $\rho<0.01$) and a “high risk” ($z=3.4$, $\rho<0.01$) of
680 rips. However, unlike Photographs 1 and 2, no statistically significant difference was observed
681 between those who correctly or incorrectly identified the safest spot to enter the water with respect
682 to: age, self-reported wave activity, swimming lessons, behavior in the absence of lifeguards,
683 importance of checking for hazards, or the ability to use the sign to identify a rip current.

684 685 **3.5 Response to the Rip Current Warning Sign** 686

687 Only 31% of all respondents believed the NOAA rip current warning sign could be used to
688 identify a rip current. Interestingly, those respondents who incorrectly identified the rip current as
689 the safest spot on the beach to enter the water tended to believe that the NOAA rip current warning
690 sign could *not* help a beach user identify a rip current. This contrasted with those who correctly
691 identified the safest location in any of the photographs ($z=5.2$, $\rho<0.01$). When asked to describe
692 how the sign could be used to identify a rip current, some of the latter respondents were able to
693 relate the rip in the picture to a real rip:

694
695 *It shows that in a rip current, there appears to be a break in the water, with water*
696 *moving in a different direction.*

697
698 *It shows you the "calm" area between the two areas of normal wave activity*
699 *indicating the channel where the rip is located*

700
701 Most of these responses focused on the pattern of wave breaking and the orientation of the ‘calmer’
702 water to the beach. There is evidence that some respondents believed the picture to be an accurate
703 representation of a rip, but they could not provide specific detail about the real-world features on
704 the beach it depicted, for example “*Graphic depiction of what the tide looks like.*” This suggests
705 that some respondents believe the sign is accurate since it was designed and placed there by an
706 authority.

707 As previously noted, the rip current warning sign was not designed to help beach users
708 identify a rip current, but rather to inform them how to escape a rip. Most respondents could clearly
709 state what the sign was informing them about swimming parallel to the beach to escape a rip:

710 *Let the current take you out and then swim parallel the shore to escape.*

711
712 *Swim parallel to the shore, or wait until the rip gets less strong further offshore.*

713
714 96% of respondents could provide a response to this question and virtually all responses indicated
715 that the sign informed them to swim parallel to shore to escape the rip current, suggesting that the
716 sign has been effective in communicating this message. When asked how seeing this sign would
717 change their behavior of the beach, a majority (65%) of respondents suggested they would take
718 precaution when entering the water:

719
720 *Might avoid going in water if I see surface signs of rip activity and drive to*
721 *another beach*

722
723 *Consider not going in. Look carefully for signs of rips. Look for flags and*
724 *lifeguards*

725
726
727 This suggests that while most respondents understood that the sign provided them with information
728 on how to escape a rip current, it also helped with prevention as most respondents also noted that
729 they would take precaution or use it to spot (and presumably avoid) a rip, rather than focus on
730 escape strategies.

731 Most respondents (86%) provided ideas on how to improve the rip current warning sign,
732 with more than half suggesting the sign needed to provide a more accurate depiction and/or
733 description of a rip current:

734
735 *I don't think it clearly identifies it enough that the waves will not break where a*
736 *rip current is. It is great because it shows how to get out of one but I think with*
737 *another picture of an actual rip current people would identify them easier.*

738
739 *Pictures showing what actual rip currents look like would be useful. / Most casual*
740 *beachgoers are not confident that they could identify a rip current from shore or*
741 *predict where one might be forming.*

742
743 *There needs to be more info on how to detect, recognize and avoid a rip current.*
744 *Information on conditions during which rip currents are most likely to form would*
745 *also be useful.*

746
747 A small number of respondents (<10%) suggested that the sign should either include step-by-step
748 instructions on what to do and/or provide more information about the experience of being caught
749 in a rip current:

750
751 *Multiple steps: / 1. Know when you're in a rip / 2. Stay calm and tread water / 3.*
752 *Wait until you've floated out to a slower moving water. / 4. Swim sideways*

753
754 *Specific instructions on what one should do if caught in a rip current - Should I*
755 *swim left, right, straight? What if I'm not a strong swimmer? What are some other*
756 *exit options?*

757
758 Another group of respondents (~15%) either did not provide suggestions on how the sign can be
759 improved or noted that it only needed minor edits, including space for local emergency numbers

760 and contacts. A small number of respondents (<5%) believed that the sign should include
761 statements that elicit fear amongst beach users including statements such as “Rip currents can
762 drown you.”

763
764 **3.6 Prevention**

765
766 One in four (25%) respondents reported they had been previously caught in a rip current by
767 accident, while 10% of respondents reported that they had purposely entered a rip for surfing.
768 When asked how to escape a rip, those who had accidentally been caught in a rip current provided
769 relatively detailed responses that either described escape by swimming parallel or riding the
770 current without panic:

771
772 *Let it flow. Don't fight it. Perhaps as long as you minimize tiring exertions try to*
773 *flow towards the side of the current. Basically do the same thing you'd do if you*
774 *fell in a strong river about to empty into a lake. You certainly wouldn't kill*
775 *yourself trying to swim out upstream.*

776
777 *Don't panic!!! Either swim - without too much exertion - parallel to the beach for*
778 *25+ yards, OR tread water and allow yourself to be carried out until the rip loses*
779 *power, then swim parallel to the beach. Once out of the rip, swim back towards*
780 *shore (again in a relaxed manner, taking time to prevent exhaustion). When*
781 *nearing the beach, take care not to get drawn back into the rip by water flow*
782 *parallel to the shoreline.*

783
784 Of those who had not been previously been in a rip 7% (n=36) did not provide a description of
785 how to escape. The remaining respondents provided relatively short responses that described
786 escape through combinations of swimming parallel and relaxation

787
788
789 Assuming no response is an indication of a lack of knowledge about rips, the number of
790 respondents who did not provide an accurate description of how to escape a rip current is ~9%,
791 suggesting that overall the campaign has been successful in informing beach users to: 1) not fight

792 the current; 2) swim out of the current, then to shore; 3) if you can't escape, float or tread water;
793 and 4) if you need help, call or wave for assistance.

794
795 **3.7 Forecasts**

796
797 Respondents were also asked about whether they were aware of rip forecasts, if forecasts
798 altered their behavior, and if the forecasts conformed with their observations at the beach. Since
799 existing rip forecasts are not consistent and few are based on an understanding of pre-existing
800 morphology, the focus here was not on the actual accuracy of the forecast, but on whether the
801 respondent believed the message to be consistent with their observations. About half of
802 respondents (52%) reported seeking information about beach and surf conditions before going to
803 a beach with the majority (83%) using the internet to find that information. A large majority (88%)
804 of respondents stated that information about beach and surf conditions affected their behavior, with
805 many saying that they would either "not go" (to the beach), "not go in the water", or "look for
806 rips". When asked whether the rip current forecast (either high or low) was consistent with
807 conditions they experienced at the beach, approximately 67% of respondents stated that the
808 forecasts were not necessarily consistent with their observations. For some, this inconsistency
809 reflected the temporal and spatial broadness of the rip forecast compared to what they observed:

810
811
812 *Weather changed quickly and no beach flags were posted, advising of rip*
813 *currents.*

814
815
816
817 *Rip currents cannot be predicted for individual beaches, they are blanket*
818 *warnings.*

819
820 Other respondents noted the forecast was inaccurate because other beach users had not adjusted
821 their behavior:

822
823 *I never noticed an[y] thing unusual and people in general don't seem to adjust*
824 *their behavior.*

825
826
827 Others noted it was not possible to determine if the forecast was accurate because they were not
828 able to spot a rip on the beach at that specific time or in general:

829
830
831
832 *I couldn't determine if/where rip tide activity might be in the water if the forecasts*
833 *had warned beach-goers to be aware of a high risk on that day.*

834
835 In several cases (n=59), respondents noted they had not heard a forecast warning of the rip hazard
836 on a given day or in general through responses such as “*I don't know if I've ever heard a rip current*
837 *forecast?*”

838 Additional questions about high-risk rip conditions solicited written responses that suggest
839 many respondents understood the high-risk warning to mean that wind and wave activity are
840 tantamount to the development of rips:

841
842 *Due to tides, weather, etc., there is a much greater risk for rip currents in the*
843 *ocean.*

844
845 There was a mix of responses in which respondents believed that ‘high risk’ meant that rips would
846 form or that there was a greater chance of rip formation. Others (n=102) believed that the use of
847 the terms high and low risk were misleading:

848
849 *Whenever or wherever there are waves there can be rip currents, so I am not sure*
850 *what ‘high’ or ‘low’ risk of rip currents means. All rips are potentially*
851 *dangerous.*

852
853 In response to the definition of low risk, respondents tended to suggest this implied that rips were
854 unlikely or would not form:

855
856 *Rip currents may still exist but are weaker or fewer than normal.*

857
858 *Conditions are not conducive to rip currents.*

859
860 *The factors necessary for rip currents to form are absent- not likely to encounter rip.*

861
862 Of note, whether a respondent described high and low risk of rips as a probability (likely, unlikely)
863 or in absolute terms (is or is not present) is not related to whether the respondent noted that the rip
864 forecast was consistent with their observations at the beach. For both high and low-risk, some
865 respondents believed that the forecast (by radio, internet, etc.) was not based on the predicted
866 weather, but rather on whether a rip had been sited on a beach or not with statements such as: “*Not*
867 *Sighted*” or “*Strong rips observed.*” Others (n=129) believed that high and low risk was associated
868 with the local bathymetry being conducive to the formation of rips: “*the topography/bathymetry*
869 *is suited to rip currents.*”

870
871 **3.8 Trusted Sources of Information**

872
873 Respondents were also asked to rank sources of information about rip currents from (1)
874 most trusted to (5) least trusted. Except for social media (including Facebook, Twitter, etc.), all
875 sources of information were nearly equally ranked from most to least trusted with no discernable
876 pattern. Only social media exhibited a discernable pattern, with more than 35% of respondents
877 identifying it as the least trusted source, although 18% of respondents also identified it as the most
878 trusted. More respondents identified internet sources as the most trusted compared to other sources,
879 while television and radio were identified as trusted (rank 2 and 3), but not the most trusted. No
880 significant correlations were observed between trust in a source of information and respondent
881 demographics, suggesting that a broad communication strategy is the most effective to reach the
882 widest audience.

4 Discussion

The primary results of this US-based rip current survey are summarised in Table 2. Results suggest that while many are not aware of the “Break the Grip of the Rip” ® campaign, the US beach-going public is informed about rip current safety. While this is an encouraging result, it needs to be placed in context. The goal of this study was to examine United States based beachgoers understanding of, and experience with, the national “Break the Grip of the Rip” ® program and the rip current hazard to provide quantitative evidence for improving the program. Despite the dissemination of the online survey leading to a potentially biased cohort (Section 2) that was dominated by respondents who were relatively frequent beachgoers, self-rated as competent swimmers, and were able to successfully identify the safest location to enter the water based on photographs, approximately 10% of survey respondents were infrequent beachgoers, poor swimmers and largely ignorant of the rip current hazard and more liable to make poor swim location choices.

899
900
901
902
903
904
905
906

When taking the entire US beachgoing population into account, this cohort represents a significant population of potential ‘at risk’ beachgoers. Given that this population was a key target of the “Break the Grip of the Rip” ® campaign, it is therefore of considerable concern that this cohort: i) tended to select the rip current as the safest location to enter the water on each of the survey photographs; ii) did not consider hazards before going to the beach; iii) were not familiar with the beach flag system in the United States; and iv) did not seek out lifeguards when visiting a beach. These results clearly highlight how at risk infrequent beach users still are despite the decadal existence and ongoing presence of the campaign.

907 In contrast, survey respondents who were frequent beachgoers and had previous
908 experience with rip currents had a better understanding of what rip currents were, the danger they
909 represent and how to escape from a rip. As described by Brannstrom and Houser (2015), those
910 who get caught in a rip current “*understand the dangers of rips first hand and.... realize [they]*
911 *never want to be caught in that situation or accident [again].*” Similar results were found in studies
912 involving surveys of people who had been caught in rip currents in Australia (Drozdewski et al.,
913 2012; 2015). Those with indirect or no experience tend to underestimate the danger compared to
914 those with direct experience (Ruin et al., 2007).

915 It is also interesting to note that while many survey respondents were not familiar with the
916 “*Break the Grip of the Rip*” ® campaign itself, a clear majority (~91%) understood the primary
917 message of the campaign and were able to provide an accurate explanation of the message (i.e.
918 “break the grip”). Respondents previously familiar with the campaign provided detailed
919 explanations of how to escape a rip by swimming parallel and/or floating until the current
920 weakened, indicating they may also have gained this knowledge from other sources.

921 Survey results also suggest that other factors can influence behavioral response in relation
922 to the rip current hazard. For example, as noted by several survey respondents, if everyone else at
923 the beach is entering the water and not heeding an existing rip current warning (out of ignorance
924 or purposeful neglect) there is a chance that the beach user may become complacent and also enter
925 the water despite understanding the risk. This suggests that decisions can be made based on what
926 other beach users are doing rather than rip forecasts (Lapinski et al., 2014). The tendency to follow
927 the behavior of others may be enhanced when someone goes together as part of a group and enters
928 the water because everyone is willfully ignoring the risk or is ignorant to the severity of the risk

929 (see Mollen et al., 2012; Aronzarena et al., 2015). A regional forecast or global warning will not
930 necessarily deter beach user behavior as much as direct intervention by lifeguards.

931 This study has also revealed some important issues with existing rip forecasting methods
932 and resultant warnings (Table 2). Approximately 67% of all respondents stated that rip current
933 forecasts are not necessarily consistent with what they observe on the beach. Consistent with
934 previous studies on natural hazards, those who have not experienced a predicted hazard or did not
935 experience personal damage during a visit to the beach are more likely to downplay the danger the
936 next time they visit (Hall and Slothower, 2009; Scolobig et al., 2012; Green et al., 1991; Mileti
937 and O'Brien, 1993). Any inconsistency between a rip forecast and direct observations therefore
938 has the potential for some beach users to downplay the rip current risk on future beach visits..
939 While forecast methodology varies by WFO, most rip forecasts do not consider bathymetry, local
940 topography, or hard structures that may force rips over a range of wind wave conditions. It is also
941 not clear how many forecasts are based on the actual presence of rips observed by lifeguards.

942 The key problem is that rip forecasts tend to be generalized for a large region and time,
943 whereas actual rip development and flow behavior is extremely variable over space and time
944 (Castelle et al., 2016). It is also difficult to predict the potential for rip development without an
945 understanding of the pre-existing nearshore morphology, which itself is difficult to measure
946 directly, remotely or through numerical modelling. A static daily regional rip warning may
947 therefore fail to replicate different rip conditions that occur during that day For beachgoers, this
948 can lead to a different interpretation of the forecast accuracy and may potentially lead to
949 downplaying the actual risk (see Brilly and Polic, 2005). Mileti and O'Brien (1993, p 40) describe
950 this reasoning as "*The first impact did not affect me negatively, therefore, subsequent impacts will*
951 *also avoid me.*" At the same time, beach users will not be able to conceptualize events that have

952 never occurred or to see future trips to the beach as anything more than a mirror of past visits or
953 experiences (Kates, 1962; Tversky and Kahneman, 1973). If the rip forecast and warnings are
954 inaccurate or perceived to be inaccurate by the beach user, there may also be a potential loss of
955 trust in that authority (Espluga et al., 2009) and future forecasts.

956 It can be assumed that beach users who rely heavily on rip forecasts and assume they are
957 accurate might use them to calibrate their own observations and experiences, which will impact
958 their future forecast expectations. If a low rip risk forecast is issued and the rips are actually
959 prevalent and strong, then beach users may lose faith in forecast accuracy. Similarly, if a high rip
960 risk forecast is issued and no rips are observed with relatively calm conditions, then beach users
961 may become complacent about the hazard and discount or ignore future forecasts in the future.
962 However, results of this study suggest that given time and experience at the beach over a range of
963 conditions, beach users can develop a nuanced understanding of the forecast and gain greater
964 confidence that it is appropriate. Rip forecast inaccuracies appear to be most problematic for
965 infrequent beach users who also do not appear to seek out lifeguards and are unable to spot rips
966 correctly.

967 A majority of respondents were able to clearly state what the standardized rip current sign
968 was informing them to do in terms of swimming parallel to the beach to escape a the rip, but many
969 identified a need to provide information that would allow beach users to identify a rip current in
970 general (e.g. “*Pictures showing what actual rip currents look like would be useful*”) or specific to
971 the local beach (e.g. “*Picture of rip at actual beach [the sign] is placed on*”). However, evidence
972 from beach surveys in Florida and Texas suggest that beach users are not able to accurately identify
973 a rip current (Caldwell et al., 2012; Brannstrom et al., 2014), although there may be ways in which
974 the sign can be made more accurate through small revisions to the perspective, colors, and beach

975 morphology (Brannstrom et al., 2015). While local information may improve the accuracy and
976 interpretation of the sign, there is the potential for different signs and messaging being used (of
977 varying quality and detail), leading to confusion and misinterpretation by beach users. A more
978 appropriate strategy may be to take a more local-approach to risk and emergency management
979 including local emergency contact information. This approach places greater authority in local
980 managers and emergency responders, without resulting in different signs.

981 A local approach also includes putting greater emphasis on the expertise of lifeguards to
982 prevent accidents and respond to emergencies promptly and properly. This would also partially
983 consider the fact that there are different types of rip currents and associated behavior in different
984 geographic locations and regions (Castelle et al., 2016). Of note, Surf Life Saving Australia has
985 recently adopted a ‘combined approach’ to promoting how to escape a rip current (Bradstreet et
986 al., 2014). This decision was largely based on field tests of rip escape strategies (McCarroll et al.,
987 2014; Van Leeuwen et al., 2016), which clearly showed that natural variance in rip flow behavior
988 influences effectiveness of different rip escape strategy strategies. This has also been illustrated by
989 recent numerical modelling studies (McCarroll et al., 2016; Castelle et al., 2016). However,
990 communicating such a complex and mixed message is problematic. In contrast, concepts of rip
991 avoidance instruction are consistent and simpler to explain, making them more suitable for
992 advertising campaigns and signage (Bradstreet et al. 2014).

993 While there is still insufficient evidence to suggest that present warning systems help
994 people avoid and escape rip currents (see also Lapinski et al., 2014), there is evidence that
995 lifeguards are effective at preventing drowning death through preventive actions and rescues. With
996 proper training and experience a lifeguard can provide invaluable local understanding of the rip
997 hazard to provide effective mitigation. Unfortunately, there is no consensus amongst beach users

998 that it is safe (or not) to swim in the surf after lifeguards are off duty (Petrass and Blitvich, 2014),
999 despite evidence that it is safer to swim in the presence of a lifeguard. In this respect, greater focus
1000 should be placed on reminding beach users to swim near lifeguards and only at times that lifeguards
1001 are present because “the chances of drowning at a beach protected by lifeguards trained under
1002 USLA standards is less than one in 18 million” (Branche et al. 2001).

1003 1004 **5 Conclusions**

1005
1006 A survey about the extent of public rip current knowledge in the United States was
1007 conducted with the aim of establishing a dataset that provides guidance for the improvement and
1008 enhancement of existing beach safety interventions. Results suggest that the US-based “Break the
1009 Grip of the Rip” ® campaign has been successful in helping inform the public about rip current
1010 safety. Although few respondents were familiar with the campaign itself, most respondents could
1011 provide an accurate description of how to escape a rip current by swimming parallel and/or floating
1012 until the current weakened. Results suggest that the most at-risk population are infrequent beach
1013 users because they do not seek out lifeguards, do not take the same precautions as frequent beach
1014 users, and believe there are large discrepancies between rip forecasts and their own observations
1015 at the beach. Survey results provide a conservative estimate of 10% of US beachgoers being at
1016 risk of being caught in a rip due to ignorance and/or poor swimming choices. Future education
1017 efforts should attempt to target this beachgoing demographic group. Knowledge of rips, visual
1018 ability to accurately identify a safe swimming location in where rip currents are present, and ability
1019 to interpret rip forecasts are each dependent on prior experience with rips and the frequency of
1020 beach visitation. In addition to concerns about the spatial and temporal accuracy of public rip
1021 forecasts, many respondents identified a lack of local detail in the rip current warning sign as a
1022 concern, with more than half of respondents suggesting the sign needed to provide a more accurate

1023 depiction and/or description of a rip current and local emergency information. This suggests a
1024 need for greater focus on locally specific and verified rip forecasts and signage in coordination
1025 with lifeguards, but not at the expense of the successful “Break the Grip of the Rip” ® campaign.

1209 **Tables**

1210

1211

1212 **Table 1.** Question groups used to elicit responses from respondents notified about the survey by
1213 various agencies in the United States.

1214

Group	Focus of Questions	Example topics
1	Informed Consent	
2	Non-identifying personal information	ZIP code, age, ethnicity, and beach use
3	Swimming behavior	Self-assessed swimming ability
4	Beach behavior and beach safety information	Frequency of visits; perceived risks at the beach
5	Rip identification and knowledge	Description of a rip current; ability to identify rip current in a photograph
6	Memorability, conspicuity, comprehension, priming	Source of rip information; memory of observing rip safety warnings
7	Rip current sign knowledge and understanding	Understanding rip current warning sign and warnings

1215

1216

1217

1218

1219 **Table 2.** Summary of major findings from the “Break the Grip of the Rip!” ® National Rip Current
 1220 Survey.
 1221

Focus of Questions	Example topics
Beach Preference	<ul style="list-style-type: none"> • Frequency and purpose of visits to a beach affect perception of surf conditions, importance of swimming near a lifeguard and self-reported ability to spot a rip current
Swimming Ability	<ul style="list-style-type: none"> • Range of self-reported swimming ability (distance in open water) related to self-reported competency
Ability to Identify a Rip Current	<ul style="list-style-type: none"> • Ability to identify safest location in a photograph related to frequency of beach visits, self-reported swimming competency and training • Ability to identify safest location related to perceived importance of and concern about surf hazards, self-reported understanding of “high” and “low” risk conditions, and perceived accuracy of rip forecasts
Response to Warning Sign	<ul style="list-style-type: none"> • Perceived ability to use sign to identify a rip current varied with ability to identify safest location on a photograph • Sign has been effective in communicating swimming parallel as an escape strategy, and taking caution when entering the water • Identified need to provide a more accurate depiction of a rip current, detailed instructions on how to escape a rip current, and local emergency information
Prevention	<ul style="list-style-type: none"> • “Break the Grip of the Rip” ® Campaign has been successful in informing beach users to: 1) not fight the current, 2) swim out of the current, then to shore, 3) if you can’t escape, float or tread water, and 4) if you need help, call or wave for assistance
Forecasts	<ul style="list-style-type: none"> • Self-reported change in behavior based on forecasted beach and surf conditions, but tendency for forecasts to be inconsistent with observations • Perceived inaccuracy of forecast related to spatial and temporal broadness of forecast, inability to identify a rip, and behavior of other beach users
Trusted Sources of Information	<ul style="list-style-type: none"> • No significant correlations were observed between trust in a source of information and respondent demographics

- 1676 Q5 Which best describes your gender
1677 Male (1)
1678 Female (2)
1679 Prefer not to answer (3)
1680
1681 Q6 What is your age?
1682 18-20 years (1)
1683 21-30 years (2)
1684 31-40 years (3)
1685 41-50 years (4)
1686 51-60 years (5)
1687 61-64 years (6)
1688 65 years and over (7)
1689
1690 Q10 Which statement about beach visitation best describes your experience?
1691 Infrequently (fewer than 10 times in my life) (1)
1692 Once every year typically on vacation (2)
1693 I go multiple times per year (3)
1694 Several times per month (4)
1695 Frequently (weekly or daily) (5)
1696
1697 Q11 How would you describe the beaches that you commonly visit?
1698 Calm with small to no waves (1)
1699 Occasional wave activity, primarily during storms (2)
1700 Regular wave activity but typically small or medium sized waves (3)
1701 Strong waves are common (4)
1702
1703 Q13 What is the main type of activity you do when you go to the beach?
1704 Swimming and wading (1)
1705 Board riding (including surfboard, boogie board, stand up, etc.) (2)
1706 Beach activities only (sunbathing, shell collecting, etc.) (3)
1707 Snorkeling or diving (4)
1708 Other (5)
1709
1710 Answer If What is the main type of activity you do when you go to the beach? Other Is Selected
1711 Q14 You answer other, please describe what you tend to do at the beach:
1712
1713 Q16 Have you ever had swimming lessons or training, either in a pool or ocean?
1714 Yes (1)
1715 No (2)
1716

- 1717 Q17 How would you rate your pool swimming ability?
1718 unable to swim (1)
1719 weak swimmer (2)
1720 competent swimmer (3)
1721 highly competent swimmer (4)
1722
1723 Q18 How far do you think you can swim in a pool before you have to stop/pause?
1724 I can't swim (5)
1725 Less than 25 yards (one length of a typical community swimming pool) (1)
1726 More that 25 yards but less than 100 yards (2)
1727 More than 100 yards but less than 500 yards (3)
1728 More than 500 yards (4)
1729
1730 Q19 How would you rate your swimming ability in open water with waves (like an ocean or
1731 lake)?
1732 I have never swum in water with lots of waves (1)
1733 Weak swimmer (2)
1734 Competent swimmer (3)
1735 Highly competent swimmer (4)
1736
1737 Q20 How far do you think you can swim in open water with waves before you have to
1738 stop/pause?
1739 Less than 25 yards (1)
1740 More than 25 yards but less than 100 yards (2)
1741 More than 100 yards but less than 500 yards (3)
1742 More than 500 yards (4)
1743 I can't swim (5)
1744
1745 Q21 Have you ever swum in an open ocean or lake with lots of wave breaking?
1746 Yes (1)
1747 No (2)
1748 Unsure (3)
1749

1750 Q22 What is the most important factor for you when choosing an ocean or lake beach to visit,
1751 with the intention of going into the water?

- 1752 Safety (are not prone to theft, etc.) (1)
- 1753 Safety in the water (avoid dangerous water hazards) (2)
- 1754 Lifeguard presence (3)
- 1755 Cleanliness of the beach and water (4)
- 1756 Crowds (prefer to be on a popular beach) (5)
- 1757 Crowds (prefer to be on a secluded, private or empty beach) (6)
- 1758 Ease of access (7)
- 1759 Avoid lots of breaking waves (i.e., prefer calm conditions) (8)
- 1760 Prefer lots of breaking waves (9)
- 1761 Other (10)

1762
1763 Answer If What is the most important factor for you when choosing an ocean or lake beach to visit,
1764 with the intention of going into the water? Other Is Selected

1765 Q23 You answered "other" to the previous questions. Please describe the most important factor
1766 for you when choosing an ocean or lake beach to visit:

1767
1768 Q24 When you go to the beach, how important is it to you to swim near a lifeguard?

- 1769 Not important (1)
- 1770 Important (2)
- 1771 Very important (3)

1772
1773 Q25 If you visit a beach with no lifeguards, do you still go into the water to wade, swim or float?

- 1774 Always (1)
- 1775 Most of the Time (2)
- 1776 Sometimes (3)
- 1777 Rarely (4)
- 1778 Never (5)

1779
1780 Q26 Do you think about or check for hazards when you go to the beach?

- 1781 Always (1)
- 1782 Most of the Time (2)
- 1783 Sometimes (3)
- 1784 Rarely (4)
- 1785 Never (5)

1786

1787 Q27 What do you think is the most dangerous hazard when you swim, wade or float at the
1788 beach?

- 1789 Jellyfish (1)
- 1790 Sharks (2)
- 1791 Big waves (3)
- 1792 Shorebreaks (4)
- 1793 Undertow (5)
- 1794 Alongshore currents (6)
- 1795 Rip currents (7)
- 1796 Surfboards/boogie boards/other swimmers (8)
- 1797 Sunburn (9)
- 1798 Other (10)

1799
1800 Answer If What do you think is the most dangerous hazard when you swim, wade or float at the
1801 beach? Other Is Selected

1802 Q28 You answered "other" to the previous question. Please identify what you think is the most
1803 dangerous hazard at the beach.

1804
1805 Q29 Have you ever seen or heard information about beach hazards. Please select all that apply.

- 1806 Never (1)
- 1807 Yes, in primary school (2)
- 1808 Yes, in high school (3)
- 1809 Yes, at university/college (4)
- 1810 Yes, from my parents (5)
- 1811 Yes, through pamphlets and brochures (6)
- 1812 Yes, through warning signs on the beach (7)
- 1813 Yes, on the internet (8)
- 1814 Yes, on television (9)
- 1815 Yes, on the radio (10)
- 1816 Yes, at my rental property in the guide material (11)
- 1817 Other (12)

1818
1819 Answer If Have you ever seen or heard information about beach hazards. Please select all
1820 that apply. Other Is Selected

1821 Q30 You answered "other" to the previous question. Please describe where you have heard about
1822 beach hazards.

1823
1824 Q31 Are you familiar with any beach safety flag system in the United States?

- 1825 Yes (1)
- 1826 No (2)

1827

1828 Answer If Are you familiar with any beach safety flag system in the United States? Yes Is Selected
1829 Q32 You answered "yes" to the previous question. Can you describe what you know about the
1830 beach safety flag system in the United States?

1831
1832 Q35 Have you heard of rip currents?

- 1833 Yes (1)
1834 No (2)

1835
1836 Answer If Have you heard of rip currents? Yes Is Selected

1837 Q37 Can you describe a rip current?

1838
1839 Q38 Where have you learned/heard about rip currents? Select all that apply.

- 1840 I have never heard of a rip current (1)
1841 Television (2)
1842 Magazine/book (3)
1843 Radio (4)
1844 Primary school (5)
1845 High school (6)
1846 College/University (7)
1847 Parents (8)
1848 Pamphlets and/or brochures (9)
1849 Internet (10)
1850 Beach signs (11)
1851 Lifeguard (12)
1852 I have been caught in one (direct experience) (13)
1853 Other (14)

1854
1855 Answer If Where on this photograph would you feel most safe to enter the water? Click on the
1856 picture at the... Is Selected

1857 Q39 You answered "other" to the previous question. Please tell us where you have heard about
1858 rip currents.

1859
1860 Q40 If you were at a beach, would you know how to spot a rip current?

- 1861 Yes, always (1)
1862 Yes, sometimes (2)
1863 No (3)
1864 You can't see a rip current (4)
1865 Unsure (5)

1866

1867 Answer If Where on this photograph would you feel most safe to enter the water? Click on the
1868 picture at the... Click X Is Selected Or Where on this photograph would you feel most safe to enter
1869 the water? Click on the picture at the... Click Y Is Selected

1870 Q41 You answered "yes" to the previous question. Can you describe what a rip current looks
1871 like?

1872
1873 Q42 Where on this photograph would you feel most safe to enter the water? Click on the picture
1874 at the spot along the beach that you believe is the safest.

1875

1883
1884
1885 Q45 Explain what you should do if caught in a rip current?
1886

1887 Q46 Have you ever been caught in a rip current?

- 1888 Yes, I was caught in a rip by accident (1)
1889 Yes, I used the rip on purpose (e.g., for surfing) (2)
1890 No (3)
1891 Not sure (4)

1892
1893 Answer If Have you ever been caught in a rip current? Yes, I was caught in a rip by accident Is
1894 Selected Or Have you ever been caught in a rip current? Yes, I used the rip on purpose (e.g. for
1895 surfing) Is Selected

1896 Q47 You answered that you had been caught in a rip current. Where (ie. what beach) were you
1897 caught in a rip current?
1898

1899 Answer If Have you ever been caught in a rip current? Yes, I was caught in a rip by accident Is
1900 Selected

1901 Q48 You answered that you were caught in a rip current by accident. How did you get out of the
1902 rip current the first time this happened to you?

1903 Self-escaped by swimming parallel to the beach first, then back to the beach (1)

1904 Self-escaped by swimming straight back to the beach (2)

1905 Self-escaped by just floating (3)

1906 Rescued by lifeguard (4)

1907 Rescued by bystander (e.g. family, friend, stranger, surfer) (5)

1908 Don't know/can't remember (6)

1909

1910 Q49 Before going to the beach, do you get information on the beach and surf conditions for the
1911 day?

1912 Yes (1)

1913 No (2)

1914

1915 Answer If Before going to the beach, do you get information on the beach and surf conditions for the
1916 day? Yes Is Selected

1917 Q50 You answered "yes" to the previous question. What source do you use to get information
1918 on the beach and surf conditions for the day? Select all that apply.

1919 Radio (1)

1920 Television (2)

1921 Internet (3)

1922 Facebook or other social media (4)

1923 Acquaintance (5)

1924 Other (6)

1925

1926 Answer If You answered "yes" to the previous question. What source do you use to get
1927 information on the beach and surf conditions for the day? Other Is Selected

1928 Q51 You answered "other" to the previous question. Please explain the other source of
1929 information about beach and surf conditions that you use.

1930

1931 Answer If Before going to the beach, do you get information on the beach and surf conditions for the
1932 day? Yes Is Selected

1933 Q52 Does this information tend to affect your behavior when you go to the beach?

1934 It doesn't affect my behavior (1)

1935 It affects my behavior (2)

1936

1937 Answer If How does the information from this site affect your behavior at the beach? If affects my
1938 behavior Is Selected

1939 Q53 Please explain how it affects your behavior at the beach.

1940

- 1941 Q54 Rank the following sources of information from "most trusted" (1) to "least trusted" (5).
 1942 ____ Radio (1)
 1943 ____ Television (2)
 1944 ____ Internet (3)
 1945 ____ Facebook or other social media (4)
 1946 ____ Acquaintance (5)

1947
 1948 Q55 Please explain why you trust one source of information more than another.

1949
 1950 Q56 Have you ever seen beach safety information at the entrance to, or on beaches, that you
 1951 have visited?

- 1952 Yes (1)
 1953 No (2)

1954
 1955 Answer If Do you remember seeing any beach safety information at the entrance to the beach or on
 1956 the beach that you visit most often? Yes Is Selected

1957 Q57 What type of beach safety information do you remember seeing?

- 1958 signs/posters (1)
 1959 flags (2)
 1960 pamphlets/brochures (3)
 1961 other (4)

1962
 1963 Answer If What type of beach safety information did you see? other Is Selected

1964 Q58 You answered "other" to the previous question. Please explain the type of beach safety
 1965 information that you tend to see at the entrance to the beach.

1966
 1967 Answer If Do you remember seeing any beach safety information at the entrance to the beach or on
 1968 the beach that you visit most often? Yes Is Selected

1969 Q59 Where do you tend to see the beach safety information?

- 1970 At the entrance to the beach (1)
 1971 On the beach (2)
 1972 Both on the beach and at the entrance to the beach (3)

1973
 1974 Answer If Do you remember seeing any beach safety information at the entrance to the beach or on
 1975 the beach that you visit most often? Yes Is Selected

1976 Q60 What is the primary message of the safety information that you tend to see?

1977
 1978 Q61 Have you ever heard of the national United States rip current education campaign called
 1979 "Break the Grip of the Rip"©?

- 1980 Yes (1)
 1981 No (2)

1982

- 1983 Answer If Have you ever heard of the "Break the Grip on the Rip" campaign? Yes Is Selected
- 1984 Q62 You answered "yes" to the previous question. Please tell us where you heard or have seen
- 1985 information related to the "Break the Grip of the Rip"© campaign. Select all that apply.
- 1986 Radio (1)
- 1987 Television (2)
- 1988 Newspaper (3)
