The comments and the suggestions provided by the reviewer gave us the opportunity to improve the article, which we much appreciate. We agree that the basic objectives of the investigation need to be improved, and the dependent and independent variables must be clarified. The section Methodology will be reorganized according to the suggestions. Figure 2 needs to be edited and more detailed information about the data collection process and scales transformations will be added. Although the results based on PCA can be questioned, since they suggest some randomness, other methods were carried out (e.g. cluster analysis) however the results obtained were very complex and confusing. The multiplicity and complexity of the variables, as a result of a heterogeneous socio-economic context, can justify the reduced linearity in the results

presented. The text will be reviewed in order to avoid some lapses (such as proactive behaviour versus passive behavior") and the English language editing will be made by a native speaker.
