We thank the Anonymous Reviewer for the careful attention given to our paper, and, especially, for their positive comments on the improvements made to our previous version. We are encouraged by the suggestion that our methods could also be applicable in other contexts and areas. Certainly, we see potential in extending this type of investigation to those densely built up residential districts of Bucharest where only narrow spaces have been left between the high blocks of workers' flats.

We are also appreciative of the suggestions of additional and up to date references. These will be incorporated in our revisions to the paper and will be valuable for any

C1

extension of our work to further areas of the city. Finally, we note the reviewer's corrections to our list of references and we will rectify these irregularities as part of our revisions to the paper.
