Received and published: 20 October 2019

In this paper the authors analyze spatial seismic hazard and loss rate variation inside administrative geographical zones in western Indonesia. They propose a novel sampling scheme to improve the efficiency of stochastic portfolio location uncertainty treatment. This paper is well written and treats an interesting subject. However, the paper has a highly technical content dealing with insurance issues and can not be easily read by people who don't have experience in this subject. I would have appreciated more details about the seismic hazard assessment and PGA CV.
