Received and published: 29 August 2019

We thank for the comments from Referee #2. The referee provided a very good point. Based on the referee's comments, we will add 1-2 paragraphs on the study area and data section to explain characteristic of landslides occurred in the study area. We have collected data on the description of landslide occurrences in the study area that can be found via the following link: <http://geospasial.bnpb.go.id/pantauanbencana/data/datalongsorcetakall.php> We found that most of landslides occurred in the study area are rainfall-induced landslide. Hence, it is relevant use soil thickness as initial indicator to assess landslide prone area. We will present a table containing detail information of the landslide events and 2 pictures of landslide events.
