Tsunamis are rare and have different characteristics each other. So that a field survey is essential. A short comment, I think authors might plot the epicenter point in their figures, although its coordinate has been mentioned in the text. Then reader will know another uniqueness of Palu tsunami that the epicenter was in land, not under-sea. Beside, author might improve the map of survey sites point, runup and inundation distance become neater (Fig 1, Fig 3 and Fig 4).
