I have read the MS entirely. The main content of this paper is to discuss the potential relationship between two common disaster in mountainous area. I think the new approach does not refer to random forests, but rather to the form of two disasters being discussed on the same susceptibility zoning map. From this point of view, the paper is innovative. The conclusion can also provide reference for the study of other forms of disaster chain. However, I found that the figures in the paper are in the wrong order, which is not correspond with the paragraph. Please double check.
