Very interesting and well written.

A few comments:

1. Title. Since the study focuses in a case study with very particular hydro-geological conditions, the name of the case study may be included in the title.
2. Abstract: The last paragraph of the abstract is confusing and seems contradictory.
3. Methods: Add a section on validation of the simulation model with empirical data, and an example by using the time series of Figure 5 (200 Average monthly groundwater recharge)
