Received and published: 29 October 2020

The paper does address relevant scientific and technical questions within the scope of NHSS. The methodology of using random Forest for regression purposes was clearly described. Although the sample size is relatively small, the results were well presented and sufficient to support the interpretations and the conclusions.

The title and the abstract are pertinent, and the overall presentation is clear and easy to understand to a wide and diversified audience. While the authors gave proper credit to their previous works, the number and quality of the references are appropriate.

The English language is of good quality, fluent, simple and easy to read and understand.
