This paper is well-written and will be very qualified after minor changes.

Here are some suggestions authors can consider: 1. The IO model used is very good. But I suggest that the advantages of the IO model should be explained compared with other research methods. 2. Some of the phraseology in the paper is suggested to be checked and revised. 3. Relevant policy studies should be added. 4. I suggest that robust analysis should be carried out. 5. Further extended research descriptions across regions, industries or products may be included if the data is allowed.
