The study is a clear and concise manuscript. The introduction is also relevant and theory based and, all methods which have been used in the study are appropriate for analysing the geophysical and the geotechnical data together. At the same time the results are clear and also, the final destination of the study helps for the better understanding of eathquake hazard within the large cities. The seismic microzonation map which has been appied on a large city like Bursa is well prepared. Overall, this is a high quality manuscript.
