We thank the reviewer for the insightful assessment of our manuscript and for the numerous comments and suggestions. We have already provided the logical reasoning to the comments that reviewers suggested. However, while analyzing the detailed natural dataset repetitively, we found that there was an error in the representative diameters for grain size classes, but the weight percentage values are correct for the dataset of Phra Thong island. The error was there only with the values of the representative diameters. The grain size classes which were mentioned in

C1

the submitted manuscript were 659, 329, 164, 82 and 41 μm respectively which will be changed to 726, 364, 182, 91 and 46 μm respectively in the revised manuscript. Hence, the DNN inversion results will be slightly changed in values. We have checked the DNN results with the revised dataset and the results were almost similar with the reported values in the manuscript. The final changes will be done on the revised manuscript. I will also upload the revised and detailed calculated dataset to zenodo repository (<https://doi.org/10.5281/zenodo.4075137>). We apologize for the inconvenience caused. I have added the revised “Thai_gs5_revised.csv” data as a supplement with this comment.
