

Interactive comment on “UAV survey method to Monitoring and analysing geological hazards: The Case study of mud volcano of Villaggio Santa Barbara, Caltanissetta (Sicily)” by Fabio Brighenti et al.

Anonymous Referee #2

Received and published: 22 January 2021

- I suggest an improvement for the literature, some recent and important paper are missing.
- The methodology must be improved, both regarding the UAV survey and SfM processing.
- Figure 1 cannot be the Orthomosaic resulting from processing, it is a result.
- Conclusions must be rewritten avoiding the long list of citation.
- Add the reference system in all figures.
