Interactive comment on "Effect of the Slope Angle and Its Classification on Landslide" *by* Seda Çellek

Anonymous Referee #2

General comments: the article is missing a clear argument and a proper structure. It is not clear whether the author is aiming for a review of literature and applications or not. There is no clearly-structured info on the argument, data and methods, results and discussions. A lot of the offered information is extremely general and many times treated very superficially. There is no clear discussion on site specificity, and there is no consistent discussion on the representativity of both literature titles (covering mostly a certain geographic distribution) and the comparison with the Turkish case-study. Specific comments: there are (very!) numerous issues, almost each page having many comments. The author is kindly asked to look into details on the comments inserted in the original .pdf. Technical corrections: the manuscript is written in poor English, thus making it really difficult to be followed in a clear manner. There are

terminological issues besides numerous writing/spelling mistakes. For details, please go through the annotated .pdf.
