9 **Abstract.**

10 The towns of Pasni and Ormara were the most severely affected by the 1945 Makran tsunami. The water inundated almost a
11 kilometer at Pasni, engulfing 80% huts of the town while at Ormara tsunami inundated two and a half kilometers washing
12 away 60% of the huts. The plate boundary between Arabian plate and Eurasian plate is marked by Makran Subduction Zone
13 (MSZ). This Makran subduction zone in November 1945 was the source of a great earthquake (8.1 Mw) and of an associated
14 tsunami. Estimated death tolls, waves arrival times, extent of inundation and runup remained vague. We summarize
15 observations of tsunami through newspaper items, eye witness accounts and archival documents. The information gathered is
16 reviewed and quantized where possible to get the inundation parameters in specific and impact in general along the Makran
17 coast. The quantization of runup and inundation extents is based on a field survey or on old maps.

18 **1 Introduction**

19 The recent tsunami events of 2004 Indian Ocean (Sumatra) tsunami, 2010 (Chile) and 2011 (Tohoku) Pacific Ocean tsunami
20 have highlighted the vulnerability of coastal areas and coastal communities to such events. Credible vulnerability assessment
21 of a coast depends upon reliable geoscientific data on past tsunami events. The data from past events is crucial as it forms the
22 basis for numerical models that simulate tsunami and tsunami hazard assessment (Hoffmann et al., 2013) which in turn can
23 be used for planning and mitigation and most importantly it can serve as an input for development of tsunami early warning
24 systems (TEWS).

25 The tsunami hazard of a coast is dependent upon the tsunami sources among many other parameters. The coast of Pakistan
26 lies in close proximity of Makran subduction zone. The historical tsunami events known in the region are sparse but have
27 been reported by several studies (Dominey-Howes et al., 2006; Heidarzadeh et al., 2008) with the oldest one being in 325
28 BC (Pararas-Carayannis, 2006). The evidences of Paleo-tsunami by MSZ are debatable (Dominey-Howes et al., 2006) as the

29 only instrumentally recorded tsunamigenic earthquake from MSZ was in November 1945, a 8.1 Mw thrust event that
30 occurred almost 8 km southeast of Pasni (Quittmeyer and Jacob, 1979). Other probable source of tsunami can be landslides
31 such as the one triggered by the 24th September 2013 inland earthquake (Baptista et al., 2020; Hoffmann et al., 2014) or from
32 the landslide on Owen ridge (Rodriguez et al., 2013).

33 The 1945 event being the only recorded event serves as the basis for modelling of tsunami in the region (Heidarzadeh et al.,
34 2008; Neetu et al., 2011; Rajendran et al., 2008) but the event itself is poorly recorded because of the aftermath of world war
35 II and political situation of then India. We have summarized the historical accounts, eyewitness accounts and newspaper
36 items to come up with the impact of the 1945 tsunami along the coastal cities of Pakistan while quantizing the data where
37 ever possible. A field survey is carried out along the three coastal cities of Gwadar, Pasni and Ormara during which
38 inundation parameters along the three cities are identified using the landmarks reported in eyewitness accounts and
39 newspaper items. Similar efforts have been carried out in different areas of the world over many years going back to at least
40 1960 Chile tsunami. More recent ones include post tsunami field surveys of 1992 Nicaragua tsunami (Satake et al., 1993),
41 Srilankan field survey of 2004 tsunami (Goff et al., 2006), 2010 Chile tsunami (Tsuji et al., 2010) and 2018 Sulawesi
42 tsunami (Mikami et al., 2019; Widiyanto et al., 2019). All these surveys were carried out immediately after the tsunami event
43 but the study presented here connects a field survey carried out recently with the tsunami event that took place
44 approximately 70 years ago. A similar study That assess the inundation parameters several years after the event has been
45 conducted in Chile for the 1960 tsunami by (Atwater et al., 2013).

46 An effort was made by Hoffmann et al. 2013 to review and summarize historical accounts, eyewitness accounts, newspaper
47 items and previously published work for the four countries connected by the Arabian Sea; Oman, Iran, India and Pakistan.
48 According to the study inundation and losses were greatest along what is now the coast of Pakistan. However, the study of
49 Hoffmann et al. 2013 did not report the runups and inundation extents or depths. Here, we report these parameters for the
50 first time, for Gwadar, Pasni and Ormara. The findings are based on the information provided in the eyewitness accounts and
51 newspaper items, a ground survey is conducted to locate the landmarks and come up with the runups and inundation extents
52 along the coast of Gwadar, Pasni and Ormara.

53 **2 Makran Earthquake of 1945 and Tsunami**

54 The 1945 tsunami was result of a thrusting event of 8.1 Mw at MSZ (Daniele E. Byrne and Dan M. Davis 1992). The
55 earthquake was felt at Muscat, along the entire coast of Makran and many other places of now Pakistan which were far
56 inland, e.g., Montgomery, Dadu, Dera Ismail Khan. The earthquake was widely recorded at different stations around the
57 world (Hoffmann et al., 2013). The earthquake was followed by five aftershocks (Daniele E. Byrne and Dan M. Davis 1992).
58 The event generated a tsunami that hit the countries in the north-western Indian Ocean.

59 **3 Impact of the 1945 Makran Tsunami**

60 The aftermath of the 1945 Makran tsunami is not very well recorded due to the political situation of the region. The study
61 reports the impact of the tsunami in general and inundation parameters in specific along three coastal cities Gwadar, Pasni
62 and Ormara. For assessing the inundation parameters that is runup and inundation extent, a ground survey was conducted to
63 locate the landmarks reported in various newspaper items and eyewitness accounts published in a UNESCO booklet by
64 Kakar et al. 2015. The lat/long of these landmarks were used to extract the inundation parameters using Google Earth.

65 **3.1 Gwadar**

66 The city of Gwadar is one of the major coastal cities along the coast of Pakistan. Recently built deep water port has added to
67 the importance of the city. Gwadar is also the hub of Gwadar district today that in itself consists of four sub-districts;
68 Gwadar, Pasni, Ormara and Jiwani.

69 In 1945 Gwadar district consisted of only Peshkan, Sur, Nigor and Pleri along with Gwadar city (see **Fig. 1** (b)). According to
70 1931 census report of India (Vol. I, Part I), chapter 1, page 13, Gwadar had been excluded from census of India because of
71 being in possession of Sultan of Muscat. Gwadar was in possession of Sultanate of Oman from 1734 to 1958. In 1945, the
72 population of Gwadar town was 5875 according to Records of Oman 1867 – 1947 (see **Fig. 1** (a)). For the same reason, no
73 information on the damages was found in Government reports of Baluchistan nor much was reported in Indian newspapers
74 regarding Gwadar. According to a hand written letter by the Sultan of Oman (Sa'eed Bin Taimoor), Gwadar suffered
75 estimated financial damages of approximately 70,000 rupees and four lives were lost (**Fig. 1** (c)).

76 The main source of information at Gwadar is eyewitness accounts
77 Table 0.1) because of absence of written history. The eyewitnesses along the coast were interviewed at the beginning of this
78 decade and are compiled and published in the form of a UNESCO booklet by Kakar et al. 2015. These eyewitness accounts
79 form the basis of assessing the approximate runup and inundation extents at Gwadar town. From eyewitness accounts the
80 places and landmarks that were reported as the inundation extent or being inundated are mapped and shown in Fig. 0.2.
81 Mulla Band and Shadu band, the two dams are the highest landmarks that were identified to be inundated by eyewitness
82 accounts. The maximum runup elevation is found at Mulla Band, approximately 56 m at a distance of 1 km from the eastern
83 shore. Apart from the two dams, all the points indicate a runup elevation of 5 to 11 m approximately and inundation extent to
84 be in between 200 to 750 m from the eastern bay (**Fig. 2**) whereas none of the eyewitness accounts report inundation along
85 the western bay this might be partly because the western bay might not be populous at that time. The wave was reported to
86 be as high as minaret or to be 3– 3.6 m by the eyewitnesses.

Fig. 1 (a) Population of Gwadar in 1945 from Records of Oman 1867 – 1947. (b) Old map of Gwadar from a letter written by Lieut. Col. J. Rasmay, agent to the Governor General and Chief Commissioner in Balochistan to mark the boundary of Gwadar and Kalat in 1913, printed in Records of Oman 1867-1947. (c) An excerpt of a letter by Sultan of Oman, Sa'eed bin Taimoor.

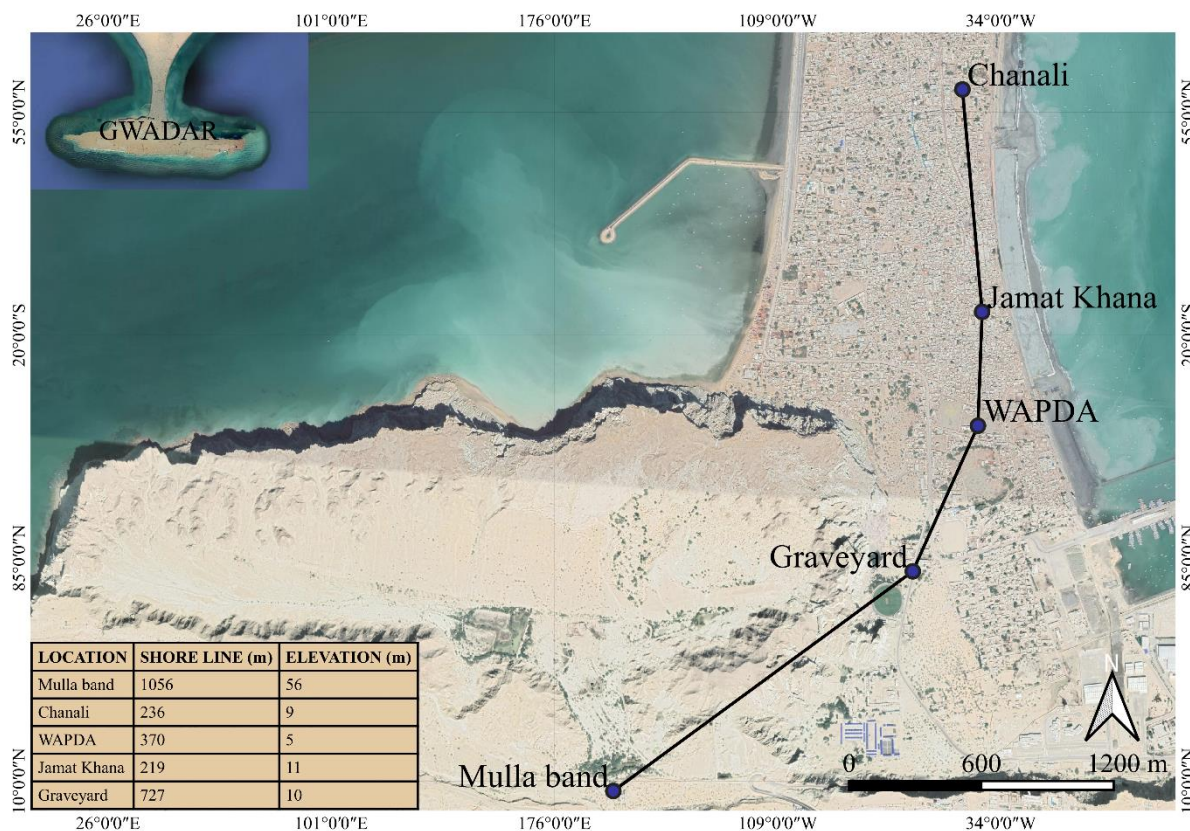

92 **Table 1 Summary of eyewitness accounts. Here EQ stands for earthquake. Wave heights are not from some datum**
 93 **but are personal interpretation of the interviewee.**

Name	Age in 1945 (yrs)	Age at the time of interview (yrs)	No. of waves	Largest wave	Reported wave heights	Reported arrival times of waves		Inundation extent/depth
Eyewitnesses at Gwadar								
Amina	20	100+	–	–	High as minaret	–	–	Mulla Band, Shadu band, ashkoki, Chanali were completely inundated. Waja Khizer, area in front of Koh e Batil was also inundated.
Mulla Murad Mohamad*	–	63	–	–	10-12 feet	–	–	–
Hassan Ali* Souhail	–	~75	–	–	–	–	–	Water Jammal Khana (15 feet deep), WAPDA house was inundated and area where Agha khani community lived was also inundated.
Master Abdul Majeed	7-8	76	–	–	–	–	–	Water came from east and crossed to the other side. The water also went southward to graveyard near Koh-e-Batil.
Hasan Ali*	–	71	–	–	–	–	–	Water came from east and went towards Mulla Band. Jammal Khana was used as shelter as the building was strong.
Eyewitnesses at Pasni								
Shamsi Mai	16-17	85	–	–	20-25 feet	–	–	2-3 km inland
Master Abdul Rasheed	12	80	–	2nd	–	Before 6:00 am	Around 6:00 am	Few km inland
Sakhi Dad	10-12	85	3	3rd	20-25 feet	6:00 am	–	–
Qadir Buksh* Kushesh	5	74	–	–	14-15 feet	–	–	–
Ajyani Guli	11	90+	3	–	–	–	–	–
Khudi Dost	10-15	80	–	–	–	30 min after EQ	–	Part of Wadsar drowned.
Karim Buksh	13	80+	7 or 8	–	–	6:00	–	Father's boat was placed by tsunami on the top of mosque.
Haroon*	~1.4	70	3	–	60,40,30 feet for 3 waves	–	–	–
Rabuk (Rabia)	5-6	74	–	–	–	–	–	Water damaged many houses and a mosque.

Ganj Buksh	14-15	82	-	-	-	-	-	destroyed houses, boats, and debris nearly as far inland as Paraag. Many houses and boats were stranded beside Jaddi Hill
Eyewitnesses at Ormara								
Dildar Sahab	12	79	3	-	-	-	-	Naik Noor Mohammad Dargah inundated with 4 feet deep water.
Qadir Buksh	15-16	84	-	-	-	1-1.5 hrs after EQ	-	Water went about as far as the present high school and reached the Naik Noor Mohammad Dragah.
Madni	10-11	76	-	-	14 feet	30 min after EQ	-	-
Shamsu din	6	73	-	-	-	30 min after EQ	-	-
Master Fateh Mohammad Baloch	15	84	3	3rd	-	5 a.m	-	Water reached Naik Noor Mohammad Dargah. <i>Gaali</i> , an Indian cargo boats wreckage was carried to Soorani Stream.
Guli	8	75	-	-	-	-	-	Water reached Naik Noor Mohammad dargah (knee deep). Family took refuge where now is Teshil Municipal Office.
Lari	11	78	-	1st	-	-	-	Water reached Naik Noor Mohammad Dargah. Water reached the area where present Fisheries Office is.
Sualeh	12-14	87	-	-	-	30 min after EQ	-	-

94 *learnt about the event through their elders.

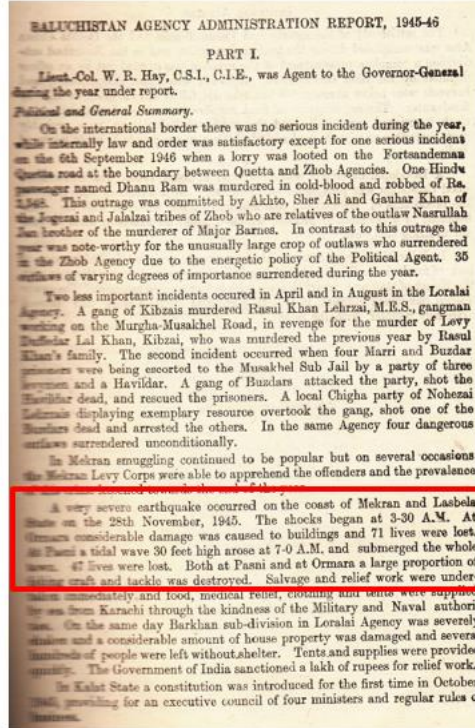

95
 96 **Fig. 2** Locations as identified by eyewitness accounts to have been inundated by the 1945 tsunami, plotted on © Google Satellite
 97 image. The line shows a crude estimate of inundation extents.

98 **3.2 Pasni**

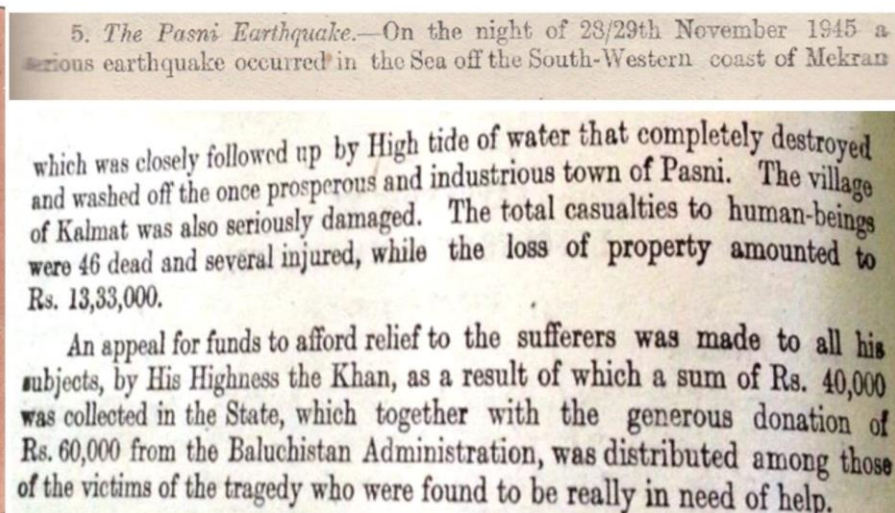

99 The City of Pasni still remains small even today. It lies on the Makran Coast on Arabian Sea about 450 km from Karachi.
 100 Administratively, Pasni is the headquarter of the Pasni sub-division of Gwadar district that includes Pasni and
 101 Ormara Tehsils (tehsil - county) as well as Astola Island which lies 40 km ESE of Pasni, in the Arabian Sea. According to
 102 census of India, Volume IV, Baluchistan (pp. 12) in 1931 total population of Pasni was 1989 (Male: 1090 and Female: 899)
 103 which grew to 3616 (Male: 1852 and Female: 1764) in 1941 (Census of India, Volume XIV, Baluchistan, pp. 14). Therefore,
 104 it is estimated that the population of Pasni in 1945 would have been in 4000s.

105 The Baluchistan Agency Administration Report 1945-46 in many of its sections described the devastation caused by a tidal
 106 wave that was preceded by an earthquake. Part I of Baluchistan Agency Administration Report 1945-46, reports of a severe
 107 earthquake on the coast of Makran and Lasbela on 28th November, 1945 at 3:30 am. It further reports that Ormara and Pasni
 108 suffered substantial damages. According to the report around 7:00 am, 30 feet high tidal wave struck Pasni, submerging the
 109 entire town while claiming 47 lives (Fig. 3).

A very severe earthquake occurred on the coast of Mekran and Lasbela State on the 28th November, 1945. The shocks began at 3-30 A.M. At Ormara considerable damage was caused to buildings and 71 lives were lost. At Pasni a tidal wave 30 feet high arose at 7-0 A.M. and submerged the whole area. 47 lives were lost. Both at Pasni and at Ormara a large proportion of fishing craft and tackle was destroyed. Salvage and relief work were under-

110

111

112

113

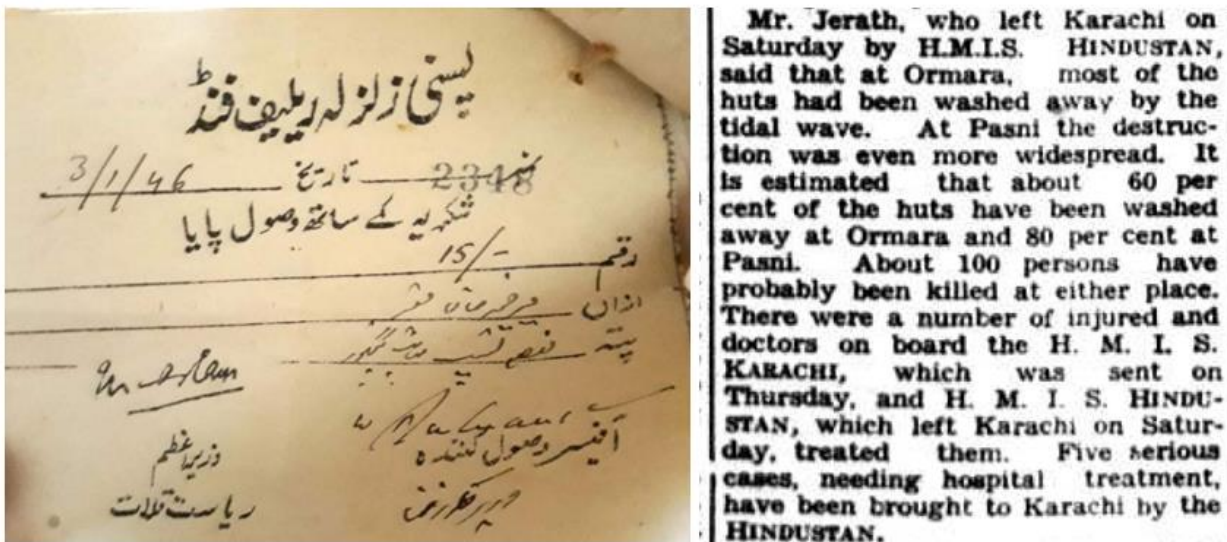

Fig. 3 (a) Excerpts of Baluchistan Agency Administration Report, 1945 – 1946, Part I. (b) Excerpts of Baluchistan Agency Administration Report, 1945 – 1946, Appendix XI, pp. 59 and 60.

114

115 Appendix XI Kalat State, of the same, reports, “A serious earthquake occurred in the Sea off the South-Western coast of
116 Makran which was closely followed up by a High Tide of water that completely destroyed and washed off the once
117 prosperous and industrious town of Pasni.” The financial damages and relief efforts at Pasni are also mentioned. It further
118 states that the Khan of Kalat, made an appeal for funds to provide relief to the sufferers which resulted in substantial amount
119 that was afterwards distributed among the people at Pasni (Fig. 4).

120 This unfortunate event was widely reported by many newspapers around the world but it was most extensively covered by
121 “Times of India.” Times of India on Friday, 30th November 1945 reported sea water rushed into the town of Pasni and
122 washed away a good number of people. Government buildings including Post and Telegraph office and rest house were
123 washed away. Times of India on Saturday, 1st December 1945 reported, “the town of Pasni is a vast sheet of water with only
124 housetops being visible....Custom House is reported to have been damaged”. Times of India on 6th December 1945 reported
125 that Mr. J. L. Jerath, Director Posts and Telegraphs, Sind and Baluchistan, who had been on H.I.M.S. Hindustan, a naval ship
126 sent to Pasni and Ormara for relief work, upon his return from Pasni and Ormara said that the 80% of the huts at Pasni and
127 60% of the huts at Ormara are estimated to be washed away by the tidal wave (Fig. 4). Sind Observer on 6th December 1945
128 reported for Pasni, “The whole village has been totally razed to the ground.....Customs goods and other properties including
129 furniture were carried away by the tidal wave to the other extreme of the village. About 7,000 people here are homeless.”

130

131 Fig. 4 Relief efforts at Pasni and Ormara. Slip for an amount of 15 PKR of Pasni Relief Fund received by a survivor of 1945
132 tsunami (on the right). Times of India clipping showing that Director Post and Telegraph went on the H.M.I.S. Hindustan to Pasni
133 and Ormara (on the left).

134

135 The inundation extents and runups were not reported in any of the government reports and newspaper items. The places,
136 Rest House and Post and Telegraph office reported by Times of India as being washed off by the tsunami; were located

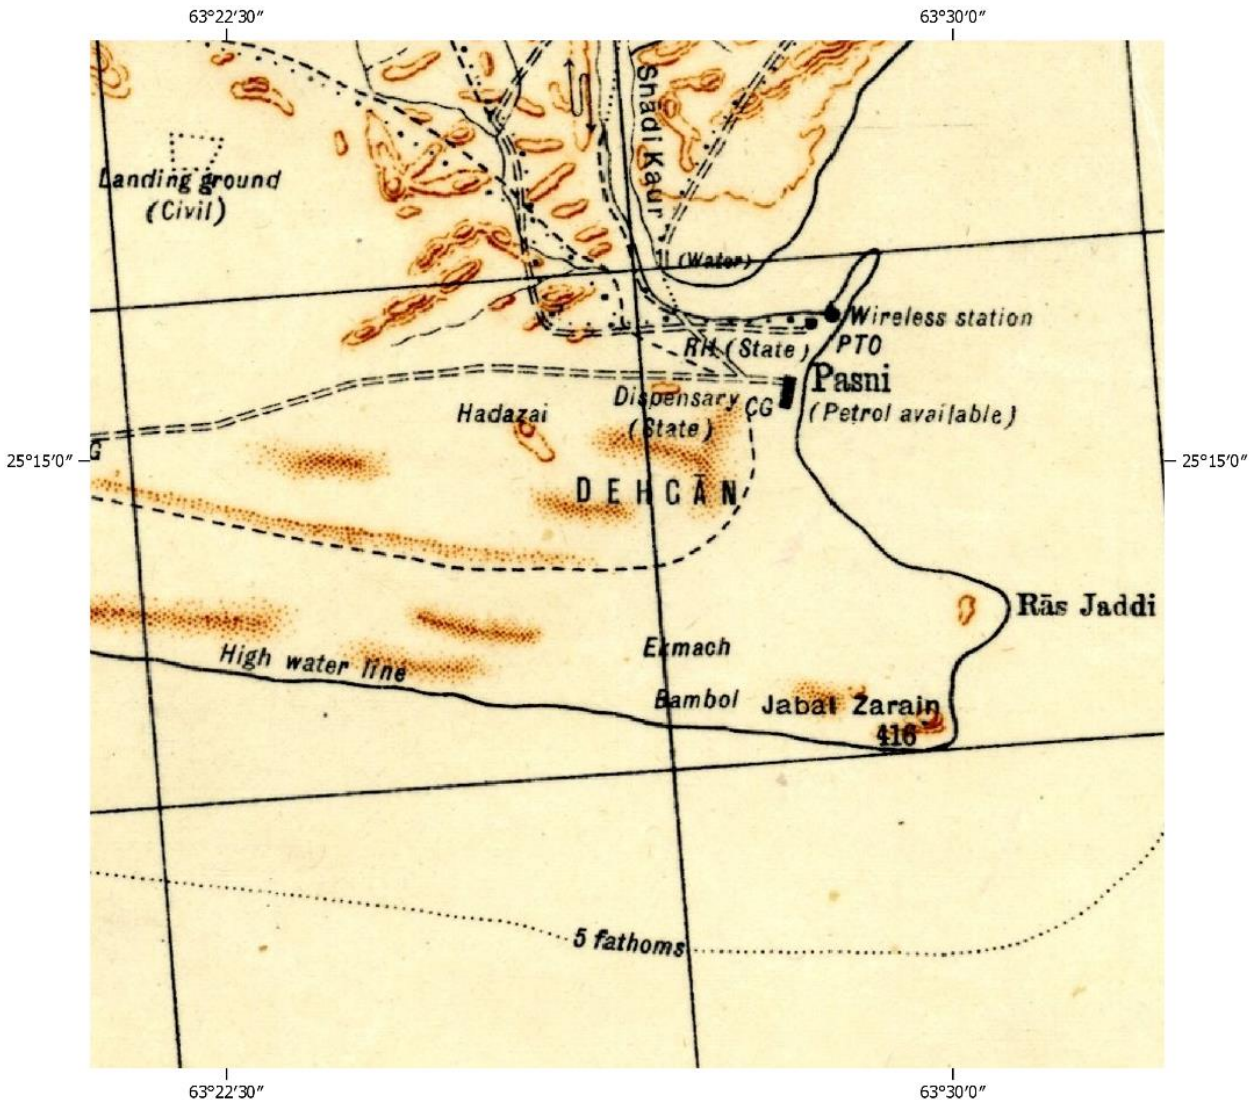

137 through an old map of the Pasni city, from 1943 (a quarter-inch sheet of by the Survey of India. G41-P Turbat, interim
 138 edition 1941, reprinted April 1943, scale 1:253,440), (Fig. 6). P.T.O. was found to be approximately 460 m and Rest House at
 139 570 m from the shoreline at that time. The shoreline of Pasni has changed since 1945, not only as a result of erosion and
 140 deposition of sediments but also because of the event itself as it is reported by many eyewitnesses that part of Pasni slid
 141 underwater.

142 The extents of inundation based on field survey following the eyewitness accounts and reported landmarks therein, are
 143 approximately 300 to 700 m from the shoreline whereas the runup elevations are between 4 – 14 m (Fig. 5). Among these
 144 points, Wadsar is the one closest to shore and also has minimum runup elevations but as this area was reported by several
 145 eyewitnesses to have been drowned or slid under water because of the event therefore we expect that location of Wadsar is
 146 not the actual inundation extent but it is rather an area which was inundated (see Fig. 5). Moreover, the number of waves as
 147 per the eyewitness accounts were three.

148

149 **Fig. 5** Locations as identified by eyewitness accounts to have been inundated by the 1945 tsunami, plotted on © Google Satellite
 150 image. The line shows a crude estimate of inundation extents. The points which have not been joined through the line were
 151 identified from newspaper accounts.

152

153 **Fig. 6 Old map of Pasni.** An excerpt from a quarter-inch sheet by the Survey of India, G41-P Turbat, interim edition 1941,
154 reprinted April 1943, scale 1:253,440.

155

156 3.3 Ormara

157 Ormara, still is not very populous but it is an important city of Gwadar district along the Makran coast. Ormara in 1945 came
158 under the Las Bela state and was part of British Balochistan. The first year for which the population for the city of Ormara
159 could be found during the study is 1981. According to a report of Pakistan bureau of statistics in 1981 total population of
160 Ormara was 8265. Therefore, it can be speculated that the city of Ormara had population in only 1,000s in 1945.

161 In the Baluchistan Agency Administrative Report Appendix XII, the damages by the 1945 event are reported stating that it
162 resulted in 78 deaths and 165 people were injured though it is unclear whether the tsunami caused the fatalities or the
163 earthquake itself caused the deaths (**Fig. 7**).

164 Devastation at Ormara, was not much less than the devastation at Pasni. As reported in Times of India, 6th Decemeber, Mr.
165 Jerath, Director Posts and Telegraph estimated 60% of huts to have been washed away by tsunami at Ormara. Dawn reported
166 on 2nd December 1945 that the town of Pasni was completely flat and the condition at Ormara is no different from Pasni.

APPENDIX XII.
ADMINISTRATION REPORT OF LAS BELA STATE FOR THE YEAR
1945-46.
CHAPTER I.—*General and Political.*

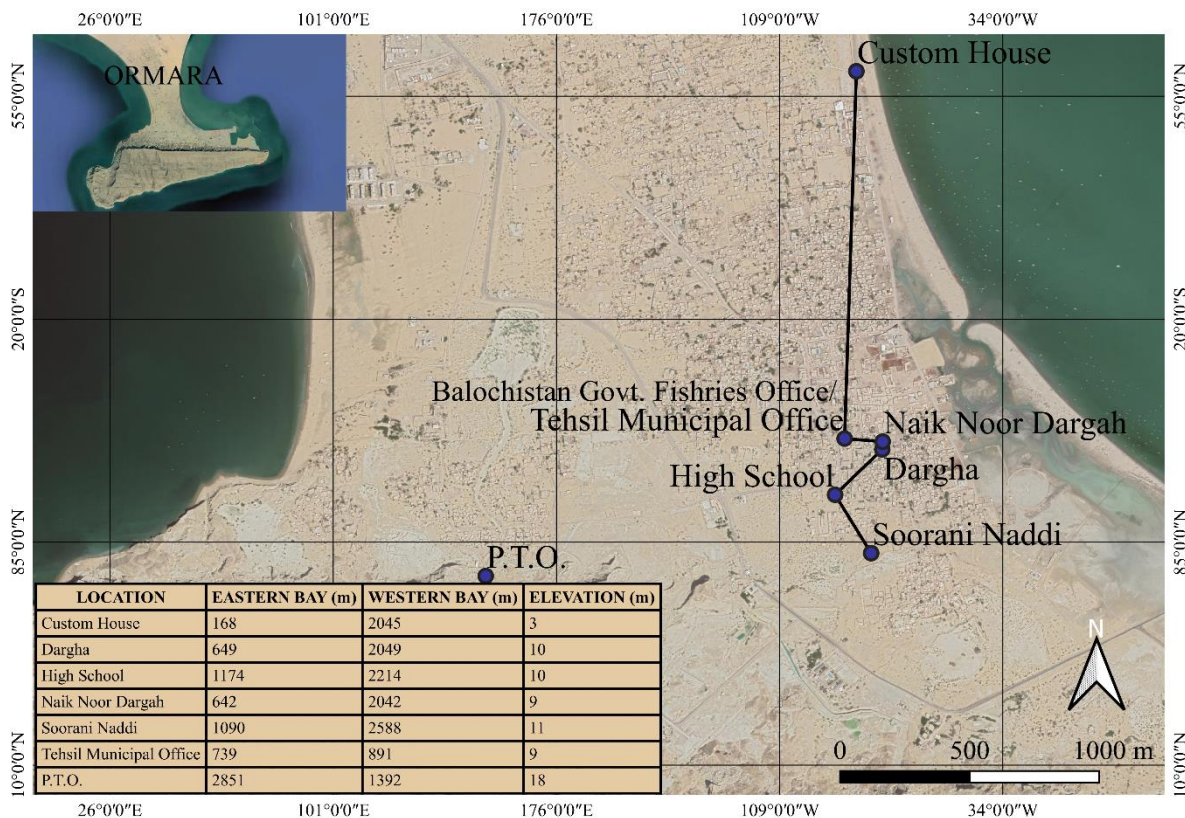

4. A severe earthquake occurred at Ormara on the 27th November 1945 resulting in 78 deaths and injuries to 165 persons. In addition, 12 persons were found missing. The loss of property is estimated to range between three to four lakhs of rupees. Relief measures were taken at the time.

167
168 **Fig. 7 Excerpts of Baluchistan Agency Administration Report, 1945 – 1946, Appendix XII**

169
170 Eyewitnesses remembered arrival of three waves after the earthquake and destruction of an Indian cargo boat, *Gaali* and the
171 wreckage being carried to Sorani stream. The waves arrived either an hour or an hour and a half after the earthquake. The
172 accounts have been quantified to get inundation extent and runup at Ormara, through ground survey. It is found that the
173 maximum runup elevation is approximately 11 m and maximum inundation extent is almost 2.5 km (**Fig. 8**).

174 The Post and Telegraph Office that was reported by Times of India to have been inundated was located through an old map
175 of the city (a quarter-inch sheet of by the Survey of India. Metadata in Kakar et al. 2015, p. XVII: G41-Q Ormara, second
176 edition 1937, scale 1:253,440) and was found to be approximately 1 km from the shoreline.

177 Interviews of local fishermen at Ormara in the 1970s, reported in (Page et al., 1979) provided evidence of uplift at Ormara
178 due to the 1945 earthquake which is interpreted by the author to be around 2m. The same is evident by the interview of Qadir
179 Buksh, “The shoreline shifted. Before the event the shore was inland of where it is today.” (Kakar et al., 2015a).

180

181 **Fig. 8** Locations as identified by eyewitness accounts to have been inundated by the 1945 tsunami, plotted on © Google Satellite
 182 image. The line shows a crude estimate of inundation extents. The point which has not been joined through the line was identified
 183 from newspaper accounts.

184 **4. Results and Discussion**

185 The historical accounts for large earthquakes along the Makran Subduction zone are sparse and disputable. Nevertheless, the
 186 possibility of large earthquakes cannot be ruled out. With Mega cities such as Karachi (Pakistan) and Mumbai (India) and
 187 many other growing coastal cities such as Gwadar (Pakistan), Chabahar (Iran) and Batinah (Oman), the seismic hazard from
 188 Makran Subduction Zone and risk of ensuing tsunamis cannot be over looked. The growing population and large investments
 189 in infrastructure along the coasts bordering the Arabian Sea demands of reliable risk assessment for tsunami in the region but
 190 not enough data is available for the same.

191 In many cases historical accounts are a valuable source of information for reconstruction of past tsunami events (Atwater et
 192 al., 2013; Dominey-Howes et al., 2006) where scientific data is not present. We first summarize the description of the 1945
 193 event in newspaper items, historical reports and eyewitness accounts and then use eyewitness accounts and newspaper items

194 combined with a field survey to extract the runups and inundation extents for coastal cities of Pakistan through the reported
195 tsunami observations there-in.

196 At Gwadar although there were not much damages but the maximum runup is found to be 56 m and maximum inundation
197 extent is around 700 m. These extents have been derived from the landmarks identified by the eyewitnesses but one of the
198 eyewitnesses (Master Abdul Majeed) also reported, “Water came from east and crossed to the other side” which is indicative
199 of tsunami engulfing the entire landmass along the east to west stretch. Another survivor of the event, Amina reported that
200 the “huge wave” did not enter the city. She further reported the water reached the mosque; water was everywhere with no
201 place to go but the water go further than the mosque. She also named some places that were inundated by the tsunami, such
202 as Mulla band and Shadu band (Kakar et al., 2015b). If these two dams (Mulla band and Shadu band) were inundated, it can
203 be expected that the water might have swept across the entire tombolo.

204 The maximum runup and inundation extent at Pasni as measured are approximately 14 m and 0.6 km, respectively. The
205 inundation extents are not the actual extents for every point marked on **Fig. 2** but in some cases mark the landmarks that were
206 identified as inundated. Moreover, the shoreline at Pasni has changed drastically since 1945 and the inundation extents for
207 most of the points have been extracted using the recent imagery from Google Earth. Therefore, these two factors can
208 contribute to the fact that the actual inundation extent in 1945 could have been greater than reported here.

209 At Ormara the maximum runup and inundation extents are approximately 11 m and 2.5 km (from Western Bay after the
210 epicenter from (Daniele E.Byrne and Dan M.Davis, 1992)) (see **Table 2**). The inundation extent at Ormara, is the greatest
211 among all the cities considered in the study although Pasni was much closer to the epicenter. This might be contributed by
212 the fact that Pasni had sand dunes near the town which according to many eyewitnesses saved their lives as it was a place of
213 refuge whereas at Ormara no such natural defense was present beside the town.

214

215 **Table 2 Impact of 1945 Makran tsunami along the coastal cities of Pakistan.**

City	Maximum runup (m)	Maximum Inundation extent (m)	Number of Waves	Maximum Wave Height (m)	Casualties	Financial Damages (Rs.)
Gwadar	56	700	–	3–6	3–4	70,000
Pasni	7.6	1000	3	9.1	47	13,33,000
Ormara	11	2500*	3	–	76	300000-400000

216 *from Western Bay

217

218 If we take the same population as 1941 (1939) and find the percentage of people who lost their lives to the 1945 tsunami
219 event at Pasni, it is found to be approximately 1.3% (considering the population of 1941 as the nearest estimate of population
220 in 1945). The town of Ormara had an estimated population of nearly 1000 and sustained 76 casualties that gives
221 approximately 8% of the population wiped off by the event.

222

223 **5 Conclusions**

224 This paper draws on the eyewitness accounts and newspaper items to estimate the runup and inundation extent at Gwadar,
225 Pasni, Ormara and Karachi. Pasni and Omara were the most severely affected cities. The inundation extent at Ormara, is the
226 greatest among all the cities considered in the study although Pasni was much closer to the epicenter. The uncertainty is
227 inherent to the parameters derived here due to reasons such as, personal interpretation of the event of the survivors and
228 survey being conducted after 70 years of the event. Therefore, the inundation parameters presented here may be crude
229 approximation of the actual parameters but it still paints a picture of the wreck-havoc caused by the 1945 Makran tsunami.
230 The data collected in the form of eyewitness accounts, archival reports and newspaper accounts from countries bordering the
231 Arabian Sea should be used to draw reliable limits on the source of the earthquake and ensuing tsunami. Similar studies in
232 the neighbouring countries can further facilitate the cause and contribute in reliable risk assessment of the coasts along the
233 Arabian Sea.

234 **Author Contribution**

235 Hira Ashfaq Lodhi prepared the manuscript, identified the landmarks from eyewitness accounts and newspaper items for the
236 field survey. Shoaib Ahmed conducted the field survey. Haider Hasan searched for archival documents.

237 **Competing Interests**

238 The authors declare that they have no conflict of interest.

239 **Funding**

240 The field survey was funded under UNDP project “Tsunami and Earthquake Preparedness in Coastal Areas of Pakistan.”

241 **Acknowledgments**

242 We acknowledge the support extended by Brain F. Atwater. His critical reviews have improved the manuscript. We also
243 acknowledge our anonymous reviewers for their input.
